About updates to the Symantec Data Loss Prevention Upgrade Guide

This guide is occasionally updated as new information becomes available.

The following table provides the history of updates to this version of the Symantec Data Loss Prevention Upgrade Guide for Windows.

Table 1: Change history for the Symantec Data Loss Prevention Upgrade Guide for Windows

<table>
<thead>
<tr>
<th>Date</th>
<th>Change description</th>
</tr>
</thead>
<tbody>
<tr>
<td>15 September 2021</td>
<td>Corrected steps for running the Reinstallation Resources Utility.</td>
</tr>
<tr>
<td>4 March 2021</td>
<td>Added steps for installing OpenJRE. Clarified that custom scripts and custom plugins are not moved to the new instance during the migration process. Corrected the location where the Symantec-provided JRE installation files are located.</td>
</tr>
<tr>
<td>22 September 2020</td>
<td>Indicated that /tmp/MacInstaller is the required location from which the create_package should be run on macOS 10.15.x and later. Removed requirement to convert database to SecureFiles format.</td>
</tr>
<tr>
<td>31 July 2020</td>
<td>Added steps for applying the latest Schema_Objects_Validation_b.sql file. Applying the latest file is required for users running the Oracle 19c database who plan to upgrade to Symantec Data Loss Prevention version 15.7.</td>
</tr>
</tbody>
</table>

About preparing to upgrade Symantec Data Loss Prevention

To review the new features for Symantec Data Loss Prevention 15.7, see the What's New and What's Changed in Symantec Data Loss Prevention 15.7: Related Documents.

You can upgrade from Symantec Data Loss Prevention version 14.x or later to the latest version. From Symantec Data Loss Prevention 12.x you can upgrade to version 14.x, then to the latest version.

Symantec Data Loss Prevention 15.7 enables you to upgrade version 14.x detection servers in stages, while still using non-upgraded detection servers to monitor and prevent confidential data loss. To upgrade to version 15.7, you begin by upgrading the Enforce Server. The upgraded Enforce Server can communicate with version 14.x detection servers for...
the purpose of recording new incidents and preventing confidential data loss. You can schedule the remaining detection server upgrades for a time that minimizes service interruption, with certain restrictions.

**NOTE**

If you are running DLP Agents on version 12.5.x, upgrade them to 14.x before you upgrade detection servers to the latest Symantec Data Loss Prevention version. Version 12.5.x agents cannot communicate with version 15.7 detection servers.

**Upgrade requirements and restrictions**

Back up your database before any upgrade. See the *Symantec Data Loss Prevention Oracle 12c Standard Edition 2 Release 2 Installation and Upgrade Guide* for more information (available at Related Documents).

**Symantec Data Loss Prevention upgrade phases**

An upgrade is performed in the phases described in the table Symantec Data Loss Prevention upgrade phases.

### Table 2: Symantec Data Loss Prevention upgrade phases

### Preparing the Oracle database for a Symantec Data Loss Prevention upgrade

The following Oracle-related preparations must be made before you upgrade the Symantec Data Loss Prevention database schema for version 15.7:

#### Table 3: Preparing the Oracle database for upgrade

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Back up the Oracle database before you start the upgrade. You cannot recover from an unsuccessful upgrade without a backup of your Oracle database.</td>
<td>See the <em>Symantec Data Loss Prevention Oracle 12c Standard Edition 2 Release 2 Installation and Upgrade Guide</em> at Related Documents.</td>
</tr>
<tr>
<td>2</td>
<td>Run the Update Readiness Tool to confirm that the Oracle database is ready to upgrade to Symantec Data Loss Prevention version 15.7.</td>
<td>Checking the database update readiness</td>
</tr>
</tbody>
</table>
| 3    | Switch the Oracle **SID** to **SERVICE_NAME** if you are upgrading from Symantec Data Loss Prevention version 14.x through 15.1.x. These versions use the Oracle **SID**. You cannot complete the upgrade process if you do not switch to the **SERVICE_NAME** parameter.  
**Note:** If you are running a fresh installation of version 15.1 that was downloaded on or after 21 September 2018, you can skip this step. This version uses the **SERVICE_NAME** by default. | Switching from SID to SERVICE_NAME |
| 4    | Set **ORACLE_HOME** and **PATH** variables. | Setting **ORACLE_HOME** and **PATH** variables |
| 5    | Confirm that the database user has permissions to connect to the Enforce Server. | Confirming the Oracle database user permissions |

### Preparing your system for the upgrade

#### Checking the database update readiness

You use the Update Readiness Tool to confirm that the Oracle database is ready to upgrade to the next Symantec Data Loss Prevention version.

**NOTE**

You can run the Update Readiness Tool while Symantec Data Loss Prevention continues to run.
Symantec recommends that you prepare for the upgrade, including running the Update Readiness Tool, a few weeks before you plan to complete the upgrade process. Preparing helps ensure that any issues that arise can be resolved before the scheduled completion date.

The Update Readiness Tool tests the following items in the database schema:

- Oracle version
- Oracle patches
- Permissions
- Tablespaces
- Existing schema against standard schema
- Real Application Clusters
- Change Data Capture
- Virtual columns
- Partitioned tables
- Numeric overflow
- Temp Oracle space

Using the Update Readiness Tool lists tasks you complete to run the tool.

### Table 4: Using the Update Readiness Tool

<table>
<thead>
<tr>
<th>Step</th>
<th>Task</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Prepare to run the Update Readiness Tool.</td>
<td>Preparing to run the Update Readiness Tool</td>
</tr>
<tr>

<td>Create the Update Readiness Tool database account.</td>
<td>Creating the Update Readiness Tool database account</td>
</tr>
</tbody>
</table>
| 3    | Run the tool. | You can run the tool for the following scenarios:  
  • From the Enforce Server.  
  • From the command line on the Enforce Server host computer.  
  • For Amazon RDS for Oracle.  
  See the "Preparing the Amazon RDS for Oracle for upgrade" topic in the Symantec Data Loss Prevention Help for information. |
| 4    | Review the update readiness results. | Reviewing update readiness results |

### Preparing to run the Update Readiness Tool

Preparing the Update Readiness Tool includes downloading the tool and moving it to the Enforce Server.

1. Obtain the current version of the tool from Product Downloads at the Broadcom Support Portal.

   The current version of the Update Readiness Tool includes important fixes and improvements, and should be the version that you use before attempting any upgrade.

   Symantec recommends that you download the tool to the directory `DLPDownloadHome\DLP\15.7`.

   **NOTE**

   Review the Readme file that is included with the tool for a list of Symantec Data Loss Prevention versions the tool can test.
2. (Optional) Confirm that you have converted the LOB tables from BasicFiles to SecureFiles format.

   About converting LOB tables from BasicFiles to SecureFiles format

3. Log on as Administrator to the database server system.

4. Confirm the following prerequisites if you are running a three-tier deployment:
   - You are running the same Oracle Client version as the Oracle Server version.
     If the versions do not match, the Oracle Client cannot connect to the database, which causes the Update Readiness Tool to fail.
   - The Oracle Client is installed as Administrator.
     If the Oracle Client is not installed as Administrator, reinstall it and select Administrator on the Select Installation Type panel. Selecting Administrator enables the command-line clients, expdp and impdp.

5. Shut down all but one instance of the database on RAC nodes if you are upgrading on a system that uses Oracle RAC.

6. Stop Oracle database jobs if your database has scheduled jobs.

   Stopping Oracle database jobs

7. Unzip the Update_Readiness_Tool.zip file, and then copy the contents of the unzipped folder to the following location. The contents of the tool folder must reside directly in the URT folder as specified:

   c:\Program Files\Symantec\DataLossPrevention\EnforceServer\15.7\Protect\Migrator\URT\URT

   During the upgrade process, the Migration Utility runs the Update Readiness Tool from this location.

About converting LOB tables from BasicFiles to SecureFiles format

If you are preparing to upgrade Symantec Data Loss Prevention, Symantec strongly recommends that you convert LOB tables from BasicFiles to SecureFiles format. Symantec recommends converting to SecureFiles format to optimize Symantec Data Loss Prevention database performance. Using SecureFiles format allows the database to reclaim storage and improves query performance. SecureFiles format also allows you to manage your LOB tablespaces.

You use the Symantec Data Loss Prevention database space reclamation utility (DLP_Lobspace_reclaim.sql) to convert the database to SecureFiles format. You can perform the conversion before upgrading to the latest version of Symantec Data Loss Prevention. You can convert the database after the upgrade using online redefinition.

Unlike BasicFiles LOB storage, SecureFiles LOB storage is sized as needed for LOB data. This allows the Oracle database to track when the data is deleted and make that space available for new LOB data (within the same LOB segment) after the retention period has expired. While allocated space to the segment does not return to the tablespace, it does not grow if the data being created within that segment is less than or equal to the data being deleted within the same segment as incidents are deleted. Using SecureFiles LOB storage eliminates the need to run the space reclamation script.

If you are upgrading to Oracle 12c, convert your Oracle 11g BasicFiles LOB storage tables to SecureFiles LOB storage format before running the Upgrade Readiness Tool and upgrading. Refer to Convert Oracle 11g BasicFiles LOB storage tables to SecureFiles LOB storage format for Oracle 12c Enterprise for steps to complete.

If you run the DLP_Lobspace_reclaim.sql on Symantec Data Loss Prevention 14.6 or 15.x, and you are using Oracle 12c R2 Standard Edition (12.2.0.1), the script fails with this message: "ERROR at line 1: ORA-00439: feature not enabled: Online Redefinition." You can refer to lobspace_reclamation.log for error information. Refer to Manually convert Oracle 12c LOB tables from BasicFiles to SecureFiles for steps to complete the conversion.
Oracle 12c Standard Edition does not support online table redefinition, which is used by the Symantec database space reclamation utility.

NOTE
Previously released versions of the utility only worked for Oracle 11g Standard databases which allowed the use of the online table redefinition.

Convert Oracle 11g BasicFiles LOB storage tables to SecureFiles LOB storage format for Oracle 12c Enterprise

Complete the following steps if you are upgrading to Oracle 12c Enterprise. Convert your Oracle 11g BasicFiles LOB storage tables to SecureFiles LOB storage format before running the Upgrade Readiness Tool and upgrading.

This solution applies to Oracle 11g Standard (11.2.0.4), Oracle 11g Enterprise (11.2.0.4), Oracle 12c Enterprise (12.1.x and 12.2.x), and Oracle 19c Enterprise (19.x) databases and allows you to continue running your system during the conversion process.

NOTE
This solution cannot be applied to Oracle 12c Standard (or later) databases. See Manually convert Oracle 12c LOB tables from BasicFiles to SecureFiles if you are on Oracle 12c or 19c Standard.

Symantec provides an update to the LOB space management script (DLP_lobspace_mgmt_b.pls). The updated script converts BasicFiles Large Object (LOB) storage to SecureFiles LOB storage in your database when you run the database space reclamation utility (DLP_Lobspace_reclaim.sql).

Unlike BasicFiles LOB storage, SecureFiles LOB storage tracks deleted LOBs and makes that space available after the retention period expires. After converting to SecureFiles LOB storage, you do not need to run a script to reclaim LOB space in your database. Space reclamation is handled automatically.

Complete the following steps to convert BasicFiles LOB storage tables to SecureFiles LOB storage format:

1. Update the LOB space management script.
   Update the LOB space management script

2. Convert the Oracle 11g or Oracle 12c Enterprise database to SecureFiles LOB storage.
   Convert the Oracle 11g or Oracle 12c Enterprise database to SecureFiles LOB storage

Update the LOB space management script

Updating the LOB space management script requires that you update the DLP_lobspace_mgmt_b.pls and DLP_Lobspace_reclaim.sql files.

The process to update your database to use SecureFiles for LOB storage requires roughly the same amount of space that the LOB_tablespace currently takes up. For example, if your LOB_tablespace takes up 20 GB, you need an extra 20 GB of space in LOB_tablespace to successfully complete the update. After you complete the process, the space utilization decreases in the LOB_tablespace, but the database displaces roughly the same amount of disc space that is required to complete the update.

NOTE
If your server does not have the disc space that is required to convert the database to SecureFiles using the DLP_Lobspace_reclaim.sql script, you can manually convert the LOB_tablespace. See Manually convert Oracle 12c LOB tables from BasicFiles to SecureFiles.

If the database uses only one data file, add more to accommodate the space that is required to run online redefinition. See article TECH159990.

NOTE
You cannot delete data files later. However, the size of the added data files eventually shrinks.
Incidents continue to be written to the Enforce Server during the SecureFile format conversion process. The process does not affect Enforce Server functions and there is minimal performance impact.

To update the files on Symantec Data Loss Prevention systems, follow these steps:

1. Obtain the latest LOB space management script by completing the following steps:
   a) Download LOB_Space_Management_Script-September2019.zip available at the article TECH252716.
   b) Move the file to a temporary location on your Enforce Server computer.

2. Navigate to where the DLP_lobspace_mgmt_b.pls and dlp_lobspace_reclaim.sql files are located on the Enforce Server (replace vv.u with the Symantec Data Loss Prevention version):
   • C:\Program Files\Symantec\DataLossPrevention\EnforceServer\vv.u\Protect\install\sql

3. Rename the DLP_lobspace_mgmt_b.pls and DLP_Lobspace_reclaim.sql files.

4. Extract the new DLP_lobspace_mgmt_b.pls and DLP_Lobspace_reclaim.sql files from the LOB_Space_Management_Script-September2019.zip file to the same directory.

Convert the Oracle 11g or Oracle 12c Enterprise database to SecureFiles LOB storage

Before you convert the database to SecureFiles LOB storage, you update the LOB space management script.

**Update the LOB space management script**

To use the database space reclamation utility to convert your Oracle 11g BasicFiles LOB storage to SecureFiles LOB storage, complete the following procedure:

1. Perform a cold backup of Oracle database before making any changes.
   
   See the Symantec Data Loss Prevention System Maintenance Guide for steps to perform a cold backup of the Oracle database. This guide is available at the Tech Docs Portal.

2. Open a command prompt and navigate to the directory that contains the database space reclamation script. Refer to step 2 in Update the LOB space management script for the location.

3. Connect to sqlplus as the SYS user:
   
   sqlplus sys/<password> as sysdba

4. Run the database space reclamation utility:
   
   @DLP_Lobspace_reclaim.sql

5. Run the following query to verify that the tables are in SecureFiles LOB storage format:
   
   select table_name, securefile from user_lobs where table_name like '%LOB%';
   
   The query returns *yes* in the *securefile* column to indicate that the tables are in SecureFiles LOB storage format.

**Manually convert Oracle 12c LOB tables from BasicFiles to SecureFiles**

This solution applies to all supported databases and requires that you shut down the system during the conversion process.

Unlike BasicFiles LOB storage, SecureFiles LOB storage tracks deleted LOBs and makes that space available after the retention period expires. After converting to SecureFiles LOB storage, you do not need to run a script to reclaim LOB space in your database. Space reclamation is handled automatically.

If you are using an Oracle 12c Standard database that still includes BasicFiles LOB storage tables, you should convert them as soon as possible. Converting takes advantage of the improved functionality of the SecureFiles LOB storage format. You must convert your tables to SecureFiles format before running the Upgrade Readiness Tool when upgrading to the next release of Symantec Data Loss Prevention.

You can manually convert your Oracle 12c LOB tables from BasicFiles to SecureFiles using the following procedure:

1. Perform a cold backup of Oracle database before making any changes.
See the Symantec Data Loss Prevention System Maintenance Guide for steps to perform a cold backup of the Oracle database. This guide is available at the Tech Docs Portal.

2. Shut down all DLP services on your Enforce Server.

**Stopping Oracle database jobs**

If your database has scheduled jobs, you must unschedule them and clear the jobs queue before you run the Update Readiness Tool and start the migration process. After the jobs are unscheduled and the jobs queue is clear, you can run the Update Readiness Tool and continue your migration.

1. Log on to SQL*Plus using the Symantec Data Loss Prevention database user name and password.
2. Run the following:
   ```sql
   BEGIN
   FOR rec IN (SELECT * FROM user_jobs) LOOP
   dbms_job.broken( rec.job, true);
   dbms_job.remove( rec.job);
   END LOOP;
   END;
   ```
3. Verify that all jobs are unscheduled by running the following:
   ```sql
   select count(*) from user_jobs;
   ```
   Confirm that the count is zero. If the count is not zero, run the command to clear the queue again. If a job is running when you attempt to clear the queue, the job continues to run until it completes and is not cleared. For long running jobs, Symantec recommends that you wait for the job to complete instead of terminating the job.
4. Exit SQL*Plus.

**Creating the Update Readiness Tool database account**

Before you can run the Update Readiness Tool, you must create a database account.

1. Navigate to the `\script` folder where you extracted the Update Readiness Tool.
2. Start SQL*Plus:
   ```sql
   sqlplus /nolog
   ```
3. Run the `oracle_create_user.sql` script:
   ```sql
   @oracle_create_user.sql
   ```
4. At the **Please enter the password for sys user** prompt, enter the password for the SYS user.
5. At the **Please enter Service Name** prompt, enter a service name for the Oracle Service Name.
6. At the **Please enter required username to be created** prompt, enter a name for the new upgrade readiness database account.
7. At the **Please enter a password for the new username** prompt, enter a password for the new upgrade readiness database account.
   Use the following guidelines to create an acceptable password:
• Passwords cannot contain more than 30 characters.
• Passwords cannot contain double quotation marks, commas, or backslashes.
• Avoid using the & character.
• Passwords are case-sensitive by default. You can change the case sensitivity through an Oracle configuration setting.
• If your password uses special characters other than _, #, or $, or if your password begins with a number, you must enclose the password in double quotes when you configure it.

Store the user name and password in a secure location for future use. You use this user name and password to run the Update Readiness Tool.

8. As the database sysdba user, grant permission to the Symantec Data Loss Prevention schema user name for the following database objects.

Run the following command if you are running the Oracle database in a non-RAC environment:

```
sqlplus sys/<password> as sysdba
GRANT READ,WRITE ON directory DATA_PUMP_DIR TO [schema user name];
GRANT SELECT ON dba_registry_history TO [schema user name];
GRANT SELECT ON dba_temp_free_space TO [schema user name];
```

9. Run the following command if you are running the Oracle database in a RAC environment:

```
sqlplus sys/<password>@<RAC node ip>:1521/protect as sysdba
GRANT READ,WRITE ON directory DATA_PUMP_DIR TO [schema user name];
```

10. Confirm that the password for the new upgrade readiness database account is compatible with the expdp and impdp commands by running the following command:

```
expdp <oracle_username>/<password>@<oracle_service_name> dumpfile=sandbox.dmp schemas=<oracle_username>
content=metadata_only directory=<dpdir> logfile=exp_sandbox.log reuse_dumpfiles=y exclude=grant
```

If the command returns password errors, create a password that meets both Oracle password and EXPDP/IMPDP password requirements (expdp/impdp are OS commands).

Table 5: Parameters for the expdp and impdp compatibility command

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;oracle_username&gt;</td>
<td>The Symantec Data Loss Prevention database user name.</td>

Preparing to run the Update Readiness Tool on page 8
Checking the database update readiness on page 7
Running the Update Readiness Tool from the Enforce Server administration console

You can run the Update Readiness Tool from the Enforce Server administration console to check the update readiness for the next Symantec Data Loss Prevention version. To run the tool, you must have User Administration (Superuser) or Server Administration user privileges.

1. Go to System > Servers and Detectors > Overview, and click System Servers and Detectors Overview.
2. Click Upload the Update Readiness Tool and locate the tool.
   
   If you the tool has already been uploaded, and you upload a new version, the old version is deleted.

   Preparing to run the Update Readiness Tool

3. Enter the Update Readiness Tool database account user credentials.

   WARNING

   Do not enter the Oracle database user (typically "protect") credentials. Entering credentials other than the Update Readiness Tool database account overwrites the Symantec Data Loss Prevention database.

4. Click Run Update Readiness Tool to begin the update readiness check.

   You can click Refresh this page to update the status of the readiness check. When you refresh, a link to a summary of results returned at that point in time displays. The process may take up to an hour depending on the size of the database.

   When the tool completes the test, you are provided with a link you can use to download the results log.

Reviewing update readiness results

Checking the database update readiness

Running the Update Readiness Tool at the command line

You can run the Update Readiness Tool from the command prompt on the database server host computer.

Disable all instances of the DLP database on all but one RAC node if you are upgrading on a system that uses Oracle RAC. Also, run the tool on the active RAC node. Restore instances once the tool has completed.

NOTE

The steps assume that you have logged on as the administrator user to the computer on which you intend to run the Update Readiness Tool.

1. Open a command prompt window.
2. Go to the URT directory:

   • c:\Program Files\Symantec\DataLossPrevention\EnforceServer\15.7\Protect\Migrator\URT
3. Run the Update Readiness Tool using the following command:

   "C:\Program Files\Symantec\DataLossPrevention\ServerJRE\1.8.0_202\bin\java" UpdateReadinessTool
   --username <schema user name>
   --password <password>
   --readiness_username <readiness_username>
   --readiness_password <readiness_password>
   --service_name <database_system_id>

Table 6: Update Readiness Tool command line parameters identifies the command line parameters:
### Table 6: Update Readiness Tool command line parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--username</td>
<td>The Symantec Data Loss Prevention schema user name.</td>
</tr>
<tr>
<td>--password</td>
<td>The Symantec Data Loss Prevention schema password.</td>
</tr>
<tr>
<td>--readiness_username</td>
<td>The Update Readiness Tool database account user that you created.</td>
</tr>
<tr>
<td></td>
<td><strong>Creating the Update Readiness Tool database account</strong></td>
</tr>
<tr>
<td>--readiness_password</td>
<td>The password for the Update Readiness Tool database account user.</td>
</tr>
<tr>
<td>--service_name</td>
<td>The database system ID (SERVICE_NAME), typically &quot;protect.&quot;</td>
</tr>
<tr>
<td></td>
<td>If you are running the database on RAC, provide the database system ID as &lt;RAC</td>
</tr>
<tr>
<td></td>
<td>node_ip&gt;protect.</td>
</tr>
<tr>
<td>--data_pump</td>
<td>The Data Pump directory name.</td>
</tr>
<tr>
<td></td>
<td>You use this optional parameter if you have opted to use a custom data pump</td>
</tr>
<tr>
<td></td>
<td>directory location.</td>
</tr>
<tr>
<td>--skip_export</td>
<td>The optional parameter prevents the Update Readiness Tool from exporting from</td>
</tr>
<tr>
<td></td>
<td>the Symantec Data Loss Prevention schema during the Update Readiness Tool test.</td>
</tr>
<tr>
<td></td>
<td>Use this parameter for the following scenarios:</td>
</tr>
<tr>
<td></td>
<td>• If you have already created an export DMP file.</td>
</tr>
<tr>
<td></td>
<td>• If you plan to export data manually.</td>
</tr>
<tr>
<td>--skip_import</td>
<td>The optional parameter prevents the Update Readiness Tool from importing data</td>
</tr>
<tr>
<td></td>
<td>to the Update Readiness Tool schema schema during the Update Readiness Tool test.</td>
</tr>
<tr>
<td></td>
<td>Use this parameter if you plan to import the data manually.</td>
</tr>
<tr>
<td>--verbose</td>
<td>The optional parameter provides additional logging detail if you plan to debug</td>
</tr>
<tr>
<td></td>
<td>the Update Readiness Tool test results.</td>
</tr>
<tr>
<td>--quick</td>
<td>The optional parameter only runs the database object check and skips the update</td>
</tr>
<tr>
<td></td>
<td>readiness test.</td>
</tr>
</tbody>
</table>

After the test completes, you can locate the results in a log file in the /output directory. This directory is located where you extracted the Update Readiness Tool. If you do not include quick when you run the tool, the test may take up to an hour to complete. You can verify the status of the test by reviewing log files in the /output directory.

### Preparing to run the Update Readiness Tool

### Reviewing update readiness results

### Reviewing update readiness results

After the test completes, you can locate the results in a log file in the /output directory. This directory is located where you extracted the Update Readiness Tool (URT). If you do not include quick when you run the tool, the test may take up to an hour to complete. You can verify the status of the test by reviewing log files in the /output directory.

**NOTE**
Symantec recommends that you contact Support prior to upgrading your system to review the URT results.

#### Related Links

- Resolving the error "Data Foreign Key Constraint Validation for EndPointProtocolFilter" on page 16

#### Resolving the error "Data Foreign Key Constraint Validation for EndPointProtocolFilter"

When running the Update Readiness Tool before an upgrade from Symantec Data Loss Prevention 14.6 to the current version, the tool returns results in its log file with the error below.

```sql
Start: Data Foreign Key Constraint Validation - [date and time] Data violations are detected on your schema, please use the below query(s) to retrieve the invalid data.
SELECT DISTINCT protocolFilterId AS "PROTOCOLFILTERID" FROM ENDPOINTPROTOCOLFILTER
WHERE protocolFilterId IS NULL OR protocolFilterId NOT IN (SELECT acv.protocolFilterId FROM AgentConfigurationVersion acv WHERE acv.protocolFilterId IS NOT NULL);
End : Data Foreign Key Constraint Validation - elapsed 0s - FAILED (1 violation)
```

Complete the following steps to resolve the error "Data Foreign Key Constraint Validation for EndPointProtocolFilter":

1. Run the following command to create a data backup:
   ```sql
   create table EndpointProtocolFilter_nomatch as select * from EndpointProtocolFilter where protocolFilterId not in (select acv.protocolFilterId FROM AgentConfigurationVersion acv where acv.protocolFilterId IS NOT NULL);
   ```
2. Run the following command to confirm the record count:
   ```sql
   select count(*) from EndpointProtocolFilter where protocolFilterId not in (select acv.protocolFilterId FROM AgentConfigurationVersion acv where acv.protocolFilterId IS NOT NULL);
   ```
3. Note the record count.
4. Run the following command to delete data that causes the upgrade to fail:
   ```sql
   DELETE FROM EndpointProtocolFilter WHERE protocolFilterId NOT IN (SELECT acv.protocolFilterId FROM AgentConfigurationVersion acv WHERE acv.protocolFilterId IS NOT NULL);
   ```
5. Confirm that the number of records deleted matches the record count. See step 3. If the record counts do not match, contact Symantec Support.
6. Run the following command to complete the delete operation:
   ```sql
   commit;
   ```
7. Run the following command to confirm that the number of records match:
   ```sql
   select count(*) from EndpointProtocolFilter where protocolFilterId not in (select acv.protocolFilterId FROM AgentConfigurationVersion acv where acv.protocolFilterId IS NOT NULL);
   ```

#### Resolving the error "Start: Index Definition Validation - Invalid Non-Primary Key Indexes INCIDENT_N13"

Complete the following to resolve the "Start: Index Definition Validation - Invalid Non-Primary Key Indexes INCIDENT_N13" error:

1. Stop all Enforce Server services.
2. Start SQL*Plus.
3. Log on as the protect user.
4. Run the following script:
   
   ```sql
   DROP INDEX INCIDENT_N13; CREATE INDEX Incident_n13 ON Incident(messageDate);
   ```
5. Restart all Enforce Server services.
6. Run the Update Readiness Tool again.

Related Links
- About Symantec Data Loss Prevention Services
- Reviewing update readiness results on page 15

**Switching from SID to SERVICE_NAME**

If you are upgrading from Symantec Data Loss Prevention 15.1 or earlier, you switch the Oracle SID to SERVICE_NAME before you upgrade. You cannot complete the migration process if you do not switch to the SERVICE_NAME parameter.

To switch from SID to SERVICE_NAME, you update the tnsnames.ora file to point to the SERVICE_NAME, and then register the service name change on the database.

After you switch to the SERVICE_NAME parameter, you can upgrade. See the Symantec Data Loss Prevention Upgrade Guide available at Related Documents.

**Switch from SID to SERVICE_NAME**

Update the tnsnames.ora file to point to the SERVICE_NAME.

1. Locate the tnsnames.ora file.
   - The file is located at `%ORACLE_HOME%\network\admin` on Windows.
2. Back up the tnsnames.ora file before you update it.
3. Stop the listener by running the following command:
   ```bash
   lsnrctl stop
   ```
   - You can skip this step if the database is already stopped.
4. Open the tnsnames.ora file.
5. Change SID to SERVICE_NAME for the protect value, where protect is your current SID.
   - The Protect section should read as follows:
     ```sql
     PROTECT =
     (DESCRIPTION =
       (ADDRESS_LIST = (ADDRESS = (PROTOCOL = TCP)(HOST = <host name>))(PORT = 1521)))
     (CONNECT_DATA =
       (SERVICE_NAME = protect)
     )
     )
     ```

**Register the service name**

Register the service name change on the database.

1. Launch SQL Plus by running the following command:
   ```sql
   sqlplus /nolog
   ```
2. Connect to the database by running the following command:
   
   ```
   conn sys/protect as sysdba
   ```

3. Set the service name by running the following command:
   
   ```
   alter system set service_names='protect' scope=both;
   ```

   Where `protect` is your new `SERVICE_NAME`.

4. Set the registry by running the following command:
   
   ```
   alter system register;
   ```

5. Verify that the Oracle database user (typically "protect") uses the `SERVICE_NAME` parameter by running the following command:
   
   ```
   select value from v$parameter where name like '%service_name%';
   ```

   Where `service_name` is the `SERVICE_NAME` parameter that connects to the Oracle database.

   The `SERVICE_NAME` value `protect` displays in the command prompt.

### Setting ORACLE_HOME and PATH variables

You set the ORACLE_HOME and PATH variables before you begin the upgrade process. If you do not set these variables, you cannot complete the migration process during the Enforce Server upgrade.

#### Set the ORACLE_HOME and PATH variable on Windows

1. Log on as a domain user.

2. In the command prompt, run the following command to set the ORACLE_HOME variable. Confirm your Oracle version and installation path before setting this variable. For example:

   ```
   set ORACLE_HOME=c:\oracle\product\19.3.0.0\db_1
   ```

3. Run the following command to set the PATH variable:

   ```
   set PATH=%ORACLE_HOME%\bin:%PATH%
   ```

### Confirming the Oracle database user permissions

The Oracle database user (typically "protect") must have permission to connect to the Enforce Server. The installation fails if the user cannot access the Enforce Server.

1. Start SQL*Plus.

2. Run the following commands:

   ```
   sqlplus sys/protect as sysdba
   GRANT read, write ON directory data_pump_dir TO protect;
   GRANT SELECT ON dba_registry_history TO protect;
   GRANT SELECT ON dba_temp_free_space TO protect;
   GRANT SELECT ON v_$version TO protect;
   GRANT EXECUTE ON dbms_lob TO protect;
   ```

3. If you are running Oracle 19c, run the following command:

   ```
   GRANT create job TO protect;
   ```

4. Exit SQL*Plus:

   ```
   exit
   ```
About the minimum system requirements for upgrading to the current release

The free disk space requirements for upgrading an existing Symantec Data Loss Prevention installation depend on the server type:

- **Enforce Server single-, two-, or three-tier installation:** 50 GB (for small/medium enterprise) to 100 GB (for large/very large enterprise) of free disk space on the volume where the server is installed.
- **Detection server:** 750 MB of free disk space on the volume where the server is installed.

**NOTE**

These numbers refer to the free disk space that is needed for the upgrade process, not the disk space that is required for server operation. For server disk space, operating system, and other requirements, see the Symantec Data Loss Prevention System Requirements and Compatibility Guide at Related Documents.

About preparing to upgrade Symantec Data Loss Prevention

**Supported upgrade backward compatibility for agents and servers**

As you upgrade your Endpoint protection, you may have different components of the suite on different versions. During the upgrade process, you may have an Enforce Server on version 15.7, Endpoint Servers on version 15.0, and agents on version 14.x. The following table describes the scenarios where multi-version servers and agents are possible. The described scenarios are only possible during the upgrade process. The scenarios assume that you have already upgraded your Enforce Server to version 15.7. You cannot upgrade either your Endpoint Servers or your agents before upgrading your Enforce Server.

**NOTE**

If your agents and Endpoint Servers are on versions earlier than 14.0, do not restart the Endpoint Server. If you restart the Endpoint Server when it is not on the current version, all policy and all configuration information is lost.

If all of the policy and the configuration information is lost, you must upgrade the Endpoint Server and the agents to the most current version. Upgrading the Endpoint Server first ensures that your servers and agents are in a supported configuration.

The most stable configuration is for all Enforce Servers, Endpoint Servers, and agents to be on version 15.7. Ideally, you will only be on one of the following backward-compatible scenarios for a limited time as you upgrade all servers and agents to version 15.7.

**NOTE**

If you are running DLP Agents on version 12.5.x, upgrade them to 14.6 before you upgrade detection servers to the latest Symantec Data Loss Prevention version. Version 12.5.x agents cannot communicate with version 15.7 detection servers.
Table 8: Supported backward compatibility for agent upgrades

Policies and configuration settings cannot be sent to Endpoint Servers and agents. If the Endpoint Server restarts, all policies and configurations are lost. Incidents are no longer sent to the server.</td>
</tr>
</tbody>
</table>

About the requirement for language pack upgrades
Symantec Data Loss Prevention requires version-specific language packs. The upgrade process removes all older language packs and rolls the user interface back to the English-language default. After the upgrade, you must download and add new versions of each language pack as needed. See the Symantec Data Loss Prevention Administration Guide (available at Related Documents) for information about acquiring and adding updated language packs.

About preparing to upgrade Symantec Data Loss Prevention

Upgrade requirements and restrictions
The following are requirements for performing an upgrade, and known issues that can occur when you upgrade Symantec Data Loss Prevention:
You must stop all Network Discover scans before you upgrade the Enforce Server to version 15.7. You cannot restart Network Discover scans until at least one Network Discover detection server has been upgraded to version 15.7.

If you have not upgraded a detection server, and it stops (shuts down) after you have upgraded the Enforce Server to version 15.7, you must upgrade that detection server to version 15.7 before it can restart.

After you upgrade the Enforce Server to version 15.7, any configuration changes that you make have no effect on detection servers not upgraded to 15.7.

After you complete the upgrade, do not modify the host name or IP address of a detection server to point to a different detection server. Detection servers use the original configured IP address or host name to maintain and report server-level statistics.

Restart the SymantecDLPDetectionServerControllerService service to verify the upgraded detection server versions in the Enforce Server administration console.

About preparing to upgrade Symantec Data Loss Prevention

Preparing your system for the upgrade

Before upgrading to the current version of Symantec Data Loss Prevention, make sure that your system meets the upgrade requirements. These requirements are described in the following topics:

Upgrade requirements and restrictions
Preparing the Oracle database for a Symantec Data Loss Prevention upgrade
Creating the Update Readiness Tool database account
Creating the Enforce Reinstallation Resources file

Make sure that you have also reviewed and acted on the information in the following topic:

About the minimum system requirements for upgrading to the current release

About external storage for incident attachments

You can store incident attachments such as email messages or documents on a file system rather than in the Symantec Data Loss Prevention database. Storing incident attachments externally saves a great deal of space in your database, providing you with a more cost-effective storage solution.

You can store incident attachments either in a directory on the Enforce Sever host computer, or on a stand-alone computer. You can use any file system you choose. Symantec recommends that you work with your data storage administrator to set up an appropriate directory for incident attachment storage.

To set up an external storage directory, Symantec recommends these best practices:

- If you choose to store your incident attachments on the Enforce Server host computer, do not place your storage directory under the Data Loss Prevention folder.
- If you choose to store incident attachments on a computer other than your Enforce Server host computer, take the following steps:
  - Ensure that both the external storage server and the Enforce Server are in the same domain.
  - Create a "SymantecDLP" user with the same password as your Enforce Server "SymantecDLP" user to use with your external storage directory.
  - If you are using a Linux system for external storage, change the owner of the external storage directory to the external storage "SymantecDLP" user.
  - If you are using a Microsoft Windows system for external storage, share the directory with Read/Write permissions with the external storage "SymantecDLP" user.

After you have set up your storage location you can enable external storage for incident attachments in the Upgrade Wizard. After you have upgraded your system to Symantec Data Loss Prevention 15.7, all new incident attachments are
stored in the external storage directory. In addition, a migration process runs in the background to move your existing incident attachments from the database to your external storage directory. Incident attachments in the external storage directory cannot be migrated back to the database. Incident attachments stored in the external storage directory are encrypted and can only be accessed from the Enforce Server administration console.

The incident deletion process deletes incident attachments in your external storage directory after it deletes the associated incident data from your database. You do not need to take any special action to delete incidents from the external storage directory.

Preparing your environment for Microsoft Rights Management file monitoring

You must complete prerequisites before enabling Microsoft Rights Management (RMS) file monitoring. The following prerequisites apply to Azure RMS or Active Directory (AD) RMS.

Prepare the AD RMS environment for RMS monitoring

Complete the following steps to prepare your AD RMS environment for monitoring:

1. Confirm that the latest AD RMS client is installed.
2. Confirm that the AD RMS account has Read and Execute permissions to access ServerCertification.asmx. For additional details, refer to the Microsoft Developer Network article: https://msdn.microsoft.com/en-us/library/mt433203.aspx.
3. Confirm that the AD RMS superuser group and Service Group both have Read and Execute permissions.
4. Add each detection server to the AD RMS domain.
5. Complete the following to change the previous Symantec Data Loss Prevention version service user to a domain user that has access to the AD RMS superuser group.
   - Shut down all services on the detection server before updating the service user.
   - Run the ChangeServiceUser.exe utility to change the service user:
     ```
     C:\Program Files\Symantec\DataLossPrevention\Protect\bin\ChangeServiceUser.exe
     USAGE: ChangeServiceUser.exe [installation directory] [new service user username] [new service user password]
     Parameters:
     [new service user password] is optional.
     ```
     ```
     C:\Program Files\Symantec\DataLossPrevention\Protect\bin\ChangeServiceUser.exe
     C:\Program Files\Symantec\DataLossPrevention\ [AD RMS domain name]\[super user username]
     [super user password]
     ```
     After running the script, the command prompt displays the change status, including the service user change status.
6. Start all services after updating the service user.

Prepare the Azure RMS environment for RMS monitoring

Complete the following steps to prepare your Azure RMS environment for RMS monitoring:

7. Confirm that the latest Azure RMS client is installed.
8. Create a local or domain user on each detection server that can access the Azure RMS.

After you upgrade the detection server, you enable the Microsoft Rights Management plug-in to complete the process to monitor Microsoft Rights Management files.

### Downloading and extracting the upgrade software

1. Download the following ZIP files from Product Downloads at the Broadcom Support Portal:
   - `Symantec_DLP_15.7_Platform.Win-IN.zip`
   - `Symantec_DLP_15.7_Agent.Win-IN.zip`: (for Endpoint deployments only)
   - `Symantec_DLP_15.7_Agent.Mac-IN.zip`: (for Endpoint deployments only)

2. Copy the ZIP files to the computer from where you intend to perform the upgrade. That computer must have a reliable network connection to the Enforce Server.

   The files within this ZIP file must be extracted into a directory on a system that is accessible to you. The root directory into which the ZIP files are extracted is referred to as the `DLPDownloadHome` directory.

4. Extract the contents of the `Symantec_DLP_15.7_Agent.Win-IN.zip` file.
5. Extract the contents of the `Symantec_DLP_15.7_Agent.Mac-IN.zip` file.
6. Note where you saved the MSI and PKG files so you can quickly find them later.

### Symantec Data Loss Prevention upgrade phases

#### Migrating the previous version to a new Enforce Server installation

Upgrading the Enforce Server includes installing the new version where the existing version is running and migrating data to the new version.

**NOTE**

The migration process backs-up services `.conf` files from Symantec Data Loss Prevention 15.5 and later. You can locate these files at `\Program Files\Symantec\DataLossPrevention\EnforceServer \vv.y\Protect\backups` in a folder that is formatted as `service-yyyy-mm-dd-hh-mm-ss. (Replace vv.u with the previous version number.) You use the `.conf` files if you are recovering your previous version system.
See the Symantec Data Loss Prevention System Maintenance Guide for more information about recovering your system (available at Related Documents).

1. Install the Java Runtime Environment on the Enforce Server.
   
   **Installing the Java Runtime Environment on the Enforce Server**

2. Run the Update Readiness Tool.
   
   Ensure that the database is ready for the migration by running the Update Readiness Tool.
   
   **Preparing to run the Update Readiness Tool**

3. Install the version 15.7 Enforce Server.
   
   You install the Enforce Server on the same system where the previous version is running.
   
   **Installing an Enforce Server**

4. Migrate the previous version to the version 15.7 Enforce Server.
   
   **Running the Migration Utility on the Enforce Server**

   The process to migrate does not move all plug-ins. **Migrating plug-ins**

### Installing the Java Runtime Environment on the Enforce Server

You install the Java Runtime Environment (JRE) on the Enforce Server before you install the Enforce Server.

To install the JRE

1. Log on (or remote logon) as Administrator to the Enforce Server system on which you intend to install Enforce.

2. Copy `ServerJRE.msi` from your DLPDownloadHome\DLP\15.7\New_Installs\Release directory to the computer where you plan to install the Enforce Server (for example, move the file to `c:\temp`).

3. Run the `ServerJRE.msi` file to display the Symantec Data Loss Prevention Server JRE Setup dialog.

4. Click **Next**.

5. After you review the license agreement, select I accept the terms in the License Agreement, and click **Next**.

6. In the **Destination Folder** panel, accept the default destination directory, or enter an alternate directory, and click **Next**.

   Symantec recommends that you use the default destination directory. References to the "installation directory" in Symantec Data Loss Prevention documentation are to this default location.

7. Click **Install** to begin the installation process.

8. Click **Finish** to complete the process.

### Installing an Enforce Server

The instructions that follow describe how to install an Enforce Server on a Windows computer in a two- or three-tier environment. The steps to install the Enforce Server in a single-tier environment are different. **Installing a single-tier server**

**NOTE**

If you are running the database in a RAC environment, confirm that the scan host IP for RAC is accessible and the nodes associated with it are all up and running during the install process.

These instructions assume that the `EnforceServer.msi` file and license file have been copied into the `c:\temp` directory on the Enforce Server computer.
NOTE

Enter directory names, account names, passwords, IP addresses, and port numbers that you create or specify during the installation process using standard 7-bit ASCII characters only. Extended (hi-ASCII) and double-byte characters are not supported.

The installation process automatically generates log information saved to a file MSI*.log (* is replaced with random characters) in the %TEMP% folder. You can change the log file name and location by running the following command with the installation:

msiexec /i EnforceServer.msi /L*v c:\temp\enforce_install.log

You can complete the installation silently or using a graphical user interface. Enter values with information specific to your installation for the following:

Table 10: Enforce Server installation parameters

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INSTALLATION_DIRECTORY</td>
<td>Specifies where the Enforce Server is installed. The default location is C:\Program Files\Symantec\DataLossPrevention.</td>
</tr>
<tr>
<td>DATA_DIRECTORY</td>
<td>Defines where Symantec Data Loss Prevention stores files that are updated while the Enforce Server is running (for example, logs and licenses). The default location is c:\ProgramData\Symantec\DataLossPrevention\EnforceServer.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If you do not use the default location, you must indicate a folder name for the data directory. If you set the data directory to the drive root (for example c:\ or e:) you cannot successfully uninstall the program.</td>
</tr>
<tr>
<td>JRE_DIRECTORY</td>
<td>Specifies the path where the JRE resides.</td>
</tr>
<tr>
<td>FIPS_OPTION</td>
<td>Defines whether to disable (Disabled) or enable (Enabled) FIPS encryption. The default is disabled.</td>
</tr>
<tr>
<td>SERVICE_USER_OPTION</td>
<td>Defines whether to create a new service user by entering NewUser or using an existing one by entering ExistingUser. The default is ExistingUser.</td>
</tr>
<tr>
<td>SERVICE_USER_USERNAME</td>
<td>Defines a name for the account that is used to manage Symantec Data Loss Prevention services. The default user name is “SymantecDLP.”</td>
</tr>
<tr>
<td>SERVICE_USER_PASSWORD</td>
<td>Defines the password for the account that is used to manage Symantec Data Loss Prevention services.</td>
</tr>
<tr>
<td>ORACLE_HOME</td>
<td>Defines the Oracle Home Directory. For example, use c:\oracle\product \12.2.0.1\db_1 to define the home directory if you use the Oracle 12.2.0.1 database.</td>
</tr>
<tr>
<td>ORACLE_HOST</td>
<td>Defines the IP address of the Oracle server computer. If you are running the Oracle database in a RAC environment, use the scan host IP address for the host, not the database IP address. Confirm that the scan host IP for RAC is accessible and that all of the nodes associated with it are running during the installation process.</td>
</tr>
<tr>
<td>ORACLE_PORT</td>
<td>Defines the Oracle listener port (typically 1521).</td>
</tr>
<tr>
<td>ORACLE_USERNAME</td>
<td>Defines the Symantec Data Loss Prevention database user name.</td>
</tr>
<tr>
<td>ORACLE_PASSWORD</td>
<td>Defines the Symantec Data Loss Prevention database password.</td>
</tr>
<tr>
<td>ORACLE_SERVICE_NAME</td>
<td>Defines the database service name (typically &quot;protect&quot;).</td>
</tr>
</tbody>
</table>

The following is an example of what the completed command might look like. The command you use differs based on your implementation requirements. Using the following command as-is may cause the installation to fail.
msiexec /i EnforceServer.msi /qn /norestart
INSTALLATION_DIRECTORY="C:\Program Files\Symantec\DataLossPrevention"
DATA_DIRECTORY="C:\ProgramData\Symantec\DataLossPrevention\EnforceServer"
JRE_DIRECTORY="C:\Program Files\Symantec\DataLossPrevention\ServerJRE\1.8.0_202"
FIPS_OPTION=Disabled
SERVICE_USER_OPTION=ExistingUser
SERVICE_USER_USERNAME=protect
SERVICE_USER_PASSWORD=Password
ORACLE_HOST=[IP or host name]
ORACLE_PORT=1521
ORACLE_USERNAME=protect
ORACLE_PASSWORD=Password
ORACLE_SERVICE_NAME=protect

1. Symantec recommends that you disable any antivirus, pop-up blocker, and registry protection software before you begin the Symantec Data Loss Prevention installation process.

2. Log on (or remote logon) as Administrator to the Enforce Server system where you intend to run the Migration Utility.

3. Go to the folder where you copied the EnforceServer.msi file (c:\temp).

   **NOTE**

   The installation process automatically generates log information saved to a file MSI*.log (replace * with random characters) in the %TEMP% folder. You can change the log file name and location by running the following command with the installation:

   msiexec /i EnforceServer.msi /L*v c:\temp\enforce_install.log

   After you complete the Enforce Server installation, you can find the log file at c:\temp.

5. In the **Welcome** panel, click **Next**.

6. After you review the license agreement, select **I accept the terms in the License Agreement**, and click **Next**.

7. In the **Destination Folder** panel, accept the default destination directory, or enter an alternate directory, and click **Next**. The default installation directory is:

   c:\Program Files\Symantec\DataLossPrevention\

   Symantec recommends that you use the default destination directory. References to the "installation directory" in Symantec Data Loss Prevention documentation are to this default location.

8. In the **Data Directory** panel, accept the default data directory, or enter an alternate directory, and click **Next**. The default data directory is:

   c:\ProgramData\Symantec\DataLossPrevention\

   **NOTE**

   If you do not use the default location, you must indicate a folder name for the data directory (for example, c:\enforcedata). If you set the data directory to the drive root (for example c:\ or e:\) you cannot successfully uninstall the program.
9. In the **JRE Directory** panel, accept the default JRE location (or click **Browse** to locate it), and click **Next**.

10. In the **FIPS Cryptography Mode** panel, select whether to disable or enable FIPS encryption.

   **About FIPS encryption**

11. In the **Service User** panel, select one of the following options.

   - **New Users**: Select this option to create the Symantec Data Loss Prevention system account user name and password and confirm the password. This account is used to manage Symantec Data Loss Prevention services. The default user name is “SymantecDLP.”

     **NOTE**

     The password you enter for the System Account must conform to the password policy of the server. For example, the server may require all passwords to include special characters.

   - **Existing Users**: Select this option to use an existing local or domain user account.

     Click **Next**.

12. In the **Oracle Database** panel, enter details about the Oracle database server. Specify one of the following options in the **Oracle Database Server** field:

<table>
<thead>
<tr>
<th>Host</th>
<th>Enter host information based on your Symantec Data Loss Prevention installation:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Single- and two-tier installation (Enforce and Oracle servers on the same system): The Oracle Server location is 127.0.0.1.</td>
</tr>
<tr>
<td></td>
<td>• Three-tier installation (Enforce Server and Oracle server on different systems): Specify the Oracle server host name or IP address. To install into a test environment that has no DNS available, use the IP address of the Oracle database server. If you are running the Oracle database in a RAC environment, use the scan host IP address for the host, not the database IP address. Confirm that the scan host IP for RAC is accessible and that all of the nodes associated with it are running during the installation process.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Port</th>
<th>Enter the <strong>Oracle Listener Port</strong>, or accept the default.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Service Name</td>
<td>Enter the database service name (typically “protect”).</td>
</tr>
<tr>
<td>Username</td>
<td>Enter the Symantec Data Loss Prevention database user name.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the Symantec Data Loss Prevention database password.</td>
</tr>
</tbody>
</table>

If your Oracle database is not the correct version, you are warned and offered the choice of continuing or canceling the installation. You can continue and upgrade the Oracle database later.

**NOTE**

Symantec Data Loss Prevention requires the Oracle database to use the AL32UTF8 character set. If your database is configured for a different character set, you are notified and the installation is canceled. Correct the problem and re-run the installer.

13. Click **Next**.

14. In the **Additional Locale** panel, select an alternate locale, or accept the default of None, and click **Next**.

   Locale controls the format of numbers and dates, and how lists and reports are alphabetically sorted. If you accept the default choice of None, English is the locale for this Symantec Data Loss Prevention installation. If you choose an alternate locale, that locale becomes the default for this installation, but individual users can select English as a locale for their use.

   See the **Symantec Data Loss Prevention Administration Guide** for more information on locales.

15. Click **Install**.

   The installation process can take a few minutes. After a successful installation, a completion notice displays.
NOTE
If you are upgrading from Symantec Data Loss Prevention version 15.1 or earlier, services are created but remain in a disabled state until you run the Enforce Server Migration Utility.

16. Restart any antivirus, pop-up blocker, or other protection software that you disabled before starting the Symantec Data Loss Prevention installation process.

17. Run the Upgrade Readiness tool to confirm that the Oracle database is ready to be migrated to the new instance.

18. Verify that the Enforce Server is properly installed.

Verifying an Enforce Server installation

Update the Schema_Objects_Validation_b.sql file if running Oracle 19c

Complete the following procedure if you are running Oracle 19c.

2. Extract Schema_Objects_Validation_b.sql from the downloaded zip file.

3. Copy the Schema_Objects_Validation_b.sql file to the following location on the Enforce Server:
   C:\Program Files\Symantec\DataLossPrevention\EnforceServer\15.7\Protect\Migrator\SQL

   NOTE
   Accept the request to overwrite the existing file.

Running the Migration Utility on the Enforce Server

The Migration Utility moves data, configurations, and custom files (data profiles, plug-ins, and incidents) to the 15.7 instance. The migration utility also stops previous version services and starts new version services.

Before you run the Migration Utility, run the Update Readiness Tool to confirm that the database is ready for migration.

You can migrate data silently or using interactive mode.

• Silent mode
• Interactive mode

Silent mode

Run the following command in an elevated command prompt:

EnforceServerMigrationUtility
-silent
-sourceVersion="previous version"

Where previous version represents the previous, active version (for example, use -sourceVersion=15.5 to migrate from Symantec Data Loss Prevention version 15.5).

Interactive mode

1. Log on (or remote logon) as Administrator to the Enforce Server system where you intend to run the Migration Utility.

2. Use the command prompt to navigate to the following directory:
   C:\Program Files\Symantec\DataLossPrevention\EnforceServer\15.7\Protect\Migrator
3. Run the Migration Utility: `EnforceServerMigrationUtility.exe`

4. Select the active Symantec Data Loss Prevention version to migrate and press `Enter`.

   The Migration Utility stops services on the previous Symantec Data Loss Prevention version and migrates data, configuration, and custom files to the new version. When the process completes, a message displays indicating that the migration has finished.

   **NOTE**
   
   The previous version is still installed but all services are in a disabled state. You can restart these services if you have rolled-back to a previous version. If you uninstall a version 15.1.x system, the service_user is removed.

5. If migration fails, review the Enforce Server `MigrationUtility.log` located at `C:\ProgramData\Symantec \DataLossPrevention\EnforceServer\15.7\logs\debug\` for more details.

### Migrating a previous version detection server to the latest version

Upgrading the detection server includes installing the new version where the existing version is running and migrating data to the new version.

**NOTE**

The migration process backs up services `.conf` files from Symantec Data Loss Prevention 15.5 and later.

You can locate these files at `\Program Files\Symantec\DataLossPrevention\DetectionServer \vv.y\Protect\backups\` in a folder formatted as `service-yyyy-mm-dd-hh-mm-ss`. *(Replace vv.u with the previous version number.)* You use the `.conf` files if you are recovering your previous version system. See the *Symantec Data Loss Prevention System Maintenance Guide* for more information about recovering your system.

1. Install the Java Runtime Environment on the detection server.

   You can skip this step if you are already running a compatible JRE version.

   **Installing the Java Runtime Environment on a detection server**

2. Install the version 15.7 detection servers.

   **Installing a detection server**

3. Migrate the previous version to the version 15.7 detection servers.

   **Running the Migration Utility on a detection server**

### Installing the Java Runtime Environment on a detection server

You install the Java Runtime Environment (JRE) on the server computer before you install the detection server.

1. Log on as Administrator to the computer on which you plan to install the detection server.

2. Copy `ServerJRE.msi` from your `DLPDownloadHome\DLP\15.7\New_Installs\Release` directory to the computer where you plan to install the detection server.

3. Run the `ServerJRE.msi` file to display the Symantec Data Loss Prevention Server JRE Setup dialog.

4. After you review the license agreement, select *I accept the terms in the License Agreement*, and click Next.

5. In the **Destination Folder** panel, accept the default destination directory, or enter an alternate directory, and click Next.

   Symantec recommends that you use the default destination directory. References to the "installation directory" in Symantec Data Loss Prevention documentation are to this default location.
6. Click **Install** to begin the installation process.
7. Click **Finish** to complete the process.

### Installing a detection server

Follow this procedure to install the detection server software on a server computer. After you install the detection server, you migrate previous version data to complete the upgrade process.

**NOTE**

The following instructions assume that the DetectionServer.msi file has been copied into the c:\temp directory on the server computer.

### About detection servers

The installation process automatically generates log information saved to a file MSI*.log (* is replaced with random characters) in the %TEMP% folder. You can change the log file name and location by running the following command with the installation:

```msiexec /i DetectionServer.msi /L*v c:\temp\detectionserver_install.log```

You can complete the installation silently from the command line. Enter values with information specific to your installation for the following:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INSTALLATION_DIRECTORY</td>
<td>Specifies where the detection server is installed. The default location is C:\Program Files \Symantec\DataLossPrevention.</td>
</tr>
</tbody>
</table>
| DATA_DIRECTORY             | Defines where Symantec Data Loss Prevention stores files that are updated while the Enforce Server is running (for example, logs and licenses). The default location is \ProgramData \Symantec\DataLossPrevention\DetectionServer\.
| **Note:** If you do not use the default location, you must indicate a folder name for the data directory. If you set the data directory to the drive root (for example c:\ or e:\) you cannot successfully uninstall the program. |
| JRE_DIRECTORY              | Specifies where the JRE resides.                                             |
| FIPS_OPTION                | Defines whether to disable (Disabled) or enable (Enabled) FIPS encryption. The default is disabled. |
| SERVICE_USER_OPTION        | Defines whether to create a new service user by entering NewUser or using an existing one by entering ExistingUser. The default is ExistingUser. |
| SERVICE_USER_USERNAME      | Defines a name for the account that is used to manage Symantec Data Loss Prevention services. The default user name is “SymantecDLP.” |
| SERVICE_USER_PASSWORD      | Defines the password for the account that is used to manage Symantec Data Loss Prevention services. |
| UPDATE_USER_USERNAME       | Defines a name for the account that is used to manage Symantec Data Loss Prevention update services. The default user name is “SymantecDLPUpdate.” |
| UPDATE_USER_PASSWORD       | Defines the password for the account that is used to manage Symantec Data Loss Prevention update services. |

The following is an example of what the completed command might look like. The command you use differs based on your implementation requirements. Using the following command as-is may cause the installation to fail.
msiexec /i DetectionServer.msi /qn /norestart
INSTALLATION_DIRECTORY="C:\Program Files\Symantec\DataLossPrevention"
DATA_DIRECTORY="C:\ProgramData\Symantec\DataLossPrevention\DetectionServer"
JRE_DIRECTORY="C:\Program Files\Symantec\DataLossPrevention\ServerJRE\1.8.0_202"
FIPS_OPTION=Disabled
SERVICE_USERgetOption=ExistingUser
SERVICE_USER_USERNAME=SymantecDLP
SERVICE_USER_PASSWORD=<password>
UPDATE_USER_USERNAME=SymantecDLPUpdate
UPDATE_USER_PASSWORD=<password>

To install a detection server

1. Ensure that installation preparations are complete.

   Preparing for a detection server installation

2. Log on as Administrator to the computer on which you plan to install the detection server.

3. If you are installing a Network Monitor detection server, install WinPcap or Npcap on the server computer.

   Follow these steps for WinPcap:
   a) On the Internet, go to https://www.winpcap.org/archive/
   b) Download WinPcap to a local drive.
   c) Double-click on the WinPcap.exe and follow the on-screen installation instructions.

   Follow these steps for Npcap:
   a) On the Internet, go to https://insecure.org
   b) Download Npcap to a local drive.
   c) Double-click on thenpcap-0.99xx.exe and follow the on-screen installation instructions.
   d) Install Npca using WinPcap Compatible Mode.

4. Copy the detection server installer (DetectionServer.msi) from the Enforce Server to a local directory on the detection server.

   DetectionServer.msi is included in your software download (DLPDownloadHome) directory.

5. Click Start > Run > Browse to navigate to the folder where you copied the DetectionServer.msi file.

6. Double-click DetectionServer.msi to execute the file, and click OK.

   The installer files unpack, and the Welcome panel of the Installation Wizard displays.

   NOTE
   The installation process automatically generates log information saved to a file MSI*.log (replace * with random characters) in the %TEMP% folder. You can change the log file name and location by running the following command with the installation:

   msiexec /i DetectionServer.msi /L*v c:\temp\detectionserver_install.log.log

7. Click Next.

   The End-User License Agreement panel displays.

8. After reviewing the license agreement, select I accept the terms in the License Agreement, and click Next.

9. In the Destination Folder panel, accept the default destination directory, or enter an alternate directory, and click Next.

   For example: c:\Program Files\Symantec\DataLossPrevention\
Symantec recommends that you use the default destination directory. However, you can click Browse to navigate to a different installation location instead.

**NOTE**
Directory names, IP addresses, and port numbers created or specified during the installation process must be entered in standard 7-bit ASCII characters only. Extended (hi-ASCII) and double-byte characters are not supported.

10. In the **Data Directory** panel, accept the default data directory, or enter an alternate directory, and click **Next**. The default data directory is:

   c:\ProgramData\Symantec\DataLossPrevention\n
   **NOTE**
   If you do not use the default location, you must indicate a folder name for the data directory. If you set the data directory to the drive root (for example c:\ or e:\) you cannot successfully uninstall the program.

11. In the **JRE Directory** panel, accept the default JRE location (or click **Browse** to locate it), and click **Next**.

12. In the **FIPS Cryptography Mode** panel, select whether to disable or enable FIPS encryption.

   **About FIPS encryption**

13. In the **Existing User** panel select the existing local or domain user account and enter the account name and password.

14. In the **Update User** panel, confirm the account name and password.

15. In the **Detection Server Default Certificates** panel, select one of the following options:

   - **Enable Default Certificates**: Select if the detection server runs on a secure network or if it is only accessible by trusted traffic.
   - **Disable Default Certificates**: Select if you plan to generate unique, self-signed certificates for your organization’s installation.

   **About the sslkeytool utility and server certificates**

16. In the **Server Bindings** panel, enter the following settings:

   - **Host**: Enter the host name or IP address of the detection server.
   - **Port**: Accept the default port number (8100) on which the detection server should accept connections from the Enforce Server. If you cannot use the default port, you can change it to any port higher than port 1024, in the range of 1024–65535.

17. Click **Install** to begin the installation process.

   The **Installing** panel appears, and displays a progress bar. After a successful installation, the **Completing** panel appears.

18. Restart any antivirus, pop-up blocker, or other protection software that you disabled before starting the detection server installation process.

### Running the Migration Utility on a detection server

You can complete the migration silently by using the following command:

```
DetectionServerMigrationUtility
-silent
-sourceVersion="previous version"
```
Symantec Data Loss Prevention Upgrade Guide for Windows

Where previous version represents where the previous, active version (for example, use `-sourceVersion=15.5` to migrate from Symantec Data Loss Prevention version 15.5.

1. Use the command prompt to navigate to the following directory:
   
   C:\Program Files\Symantec\DataLossPrevention\DetectionServer\15.7\Protect\Migrator
   
   
3. Select the Symantec Data Loss Prevention version to migrate and press Enter.
   
   The Migration Utility stops services on the previous Symantec Data Loss Prevention version and migrates data, configuration, and custom files to the new version. When the process completes a message displays indicating that the migration has finished.
   
   **NOTE**
   
   The previous version is still installed but all services are in a disabled state. You can restart these services if you re-used the service_user during the version 15.7 installation. If you uninstall the previous version, the service_user is removed.

4. If the migration fails, review the detection server migration logs in `MigrationUtility.log` located at

   C:\ProgramData\Symantec\DataLossPrevention\DetectionServer\15.7\logs\debug.

Migrating previous version data to a new single-tier installation

After you install the version 15.7 single-tier system, you use the Migration Utility to migrate data to the new instance. Before you run the Migration Utility, run the Update Readiness Tool to confirm that the database is ready for migration.

**NOTE**

The migration process backs up `.conf` files from Symantec Data Loss Prevention 15.5 and later. You can locate these files at `\Program Files\Symantec\DataLossPrevention\SingleTierServer\vv.y\Protect\backups\` in a folder formatted as `service-yyyy-mm-dd-hh-mm-ss`. (Replace `vv.u` with the previous version number.) You use the `.conf` files if you are recovering your previous version system. See the Symantec Data Loss Prevention System Maintenance Guide for more information about recovering your system (available at Related Documents).

1. Install the Java Runtime Environment on the Enforce Server.
   
   You can skip this step if you are already running a compatible JRE version.

2. Run the Update Readiness Tool.
   
   Running the tool identifies potential issues with the database.

   **Creating the Update Readiness Tool database account**

3. Install the version 15.7 single-tier system.
   
   You install the single-tier system on the same computer where the previous version is running.

4. Migrate the previous version to the version 15.7 single-tier installation.
   
   **Running the Migration Utility on single-tier installation**
Installing the Java Runtime Environment for a single-tier installation

You install the Java Runtime Environment (JRE) before you complete a single-tier installation.

1. Log on (or remote logon) as Administrator to the computer where you plan to install the single-tier system.
2. Copy ServerJRE.msi to the computer where you plan to install the single-tier system.
3. Unzip the file contents (for example, unzip to c:\temp).
4. Run the ServerJRE.msi file to display the Symantec Data Loss Prevention Server JRE Setup dialog.
5. After you review the license agreement, select I accept the terms in the License Agreement, and click Next.
6. In the Destination Folder panel, accept the default destination directory, or enter an alternate directory, and click Next.
   Symantec recommends that you use the default destination directory. References to the "installation directory" in Symantec Data Loss Prevention documentation are to this default location.
7. Click Install to begin the installation process.
8. Click Finish to complete the process.

Installing a single-tier server

Symantec recommends that you disable any antivirus, pop-up blocker, and registry-protection software before you begin the Symantec Data Loss Prevention installation process.

**NOTE**

Create the Enforce Reinstallation Resources file before starting the installation process. This file contains the unique CryptoMasterKey.properties file and keystore files for your Symantec Data Loss Prevention deployment that you can use if you need to uninstall your deployment.

Creating the Enforce Reinstallation Resources file

The following instructions assume that the SingleTierServer.msi file, license file, and solution pack file have been copied into the c:\temp directory on the Enforce Server.

The installation process automatically generates log information saved to a file MSI*.log (* is replaced with random characters) in the %TEMP% folder. You can change the log file name and location by running the following command with the installation:

```
msiexec /i SingleTierServer.msi /L*v c:\temp\enforce_install.log.
```

After you complete the Single Tier installation, you can find the installation log file at c:\temp\.

You can complete the installation silently from the command line. Enter values with information specific to your installation for the following:
## Table 12: Single-tier server installation parameters

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INSTALLATION_DIRECTORY</td>
<td>Specifies where the Enforce Server is installed. The default location is C:\Program Files\Symantec\DataLossPrevention.</td>
</tr>
<tr>
<td>DATA_DIRECTORY</td>
<td>Defines where Symantec Data Loss Prevention stores files that are updated while the Enforce Server is running (for example, logs and licenses). The default location is C:\ProgramData\Symantec\DataLossPrevention. Note: If you do not use the default location, you must indicate a folder name for the data directory. If you set the data directory to the drive root (for example c:\ or e:) you cannot successfully uninstall the program.</td>
</tr>
<tr>
<td>JRE_DIRECTORY</td>
<td>Specifies where the JRE resides.</td>
</tr>
<tr>
<td>FIPS_OPTION</td>
<td>Defines whether to disable (Disabled) or enable (Enabled) FIPS encryption. The default is disabled.</td>
</tr>
<tr>
<td>SERVICE_USER_OPTION</td>
<td>The default is ExistingUser. Enter ExistingUser to use the service user from the previous release.</td>
</tr>
<tr>
<td>SERVICE_USER_USERNAME</td>
<td>Defines a name for the account that is used to manage Symantec Data Loss Prevention services. The default user name is “SymantecDLP.”</td>
</tr>
<tr>
<td>SERVICE_USER_PASSWORD</td>
<td>Defines the password for the account that is used to manage Symantec Data Loss Prevention services.</td>
</tr>
<tr>
<td>ORACLE_HOME</td>
<td>Defines the Oracle Home Directory. For example, use c:\oracle \product\12.2.0.1\db_1 to define the home directory if you use the Oracle 12.2.0.1 database.</td>
</tr>
<tr>
<td>ORACLE_HOST</td>
<td>Defines the IP address of the Oracle server computer. Note: If you are running the Oracle database in a RAC environment, use the Scan Host IP address for Oracle Host, not the database IP address.</td>
</tr>
<tr>
<td>ORACLE_PORT</td>
<td>Defines the Oracle listener port (typically 1521).</td>
</tr>
<tr>
<td>ORACLE_USERNAME</td>
<td>Defines the Symantec Data Loss Prevention database user name.</td>
</tr>
<tr>
<td>ORACLE_PASSWORD</td>
<td>Defines the Symantec Data Loss Prevention database password.</td>
</tr>
<tr>
<td>ORACLE_SERVICE_NAME</td>
<td>Defines the database service name (typically &quot;protect&quot;).</td>
</tr>
<tr>
<td>UPDATE_USER_USERNAME</td>
<td>Defines a name for the account that is used to manage Symantec Data Loss Prevention update services. The default user name is “SymantecDLPUpdate.”</td>
</tr>
<tr>
<td>UPDATE_USER_PASSWORD</td>
<td>Defines the password for the account that is used to manage Symantec Data Loss Prevention update services.</td>
</tr>
<tr>
<td>ADDITIONAL_LOCALE</td>
<td>Defines an additional locale for use by individual users.</td>
</tr>
<tr>
<td>ENFORCE_ADMINISTRATOR_PASSWORD</td>
<td>This parameter is required during the migration.</td>
</tr>
</tbody>
</table>

The following is an example of what the completed command might look like. The command you use differs based on your implementation requirements. Using the following command as-is may cause the installation to fail.

```
msiexec /i SingleTierServer.msi /qn /norestart
INSTALLATION_DIRECTORY="C:\Program Files\Symantec\DataLossPrevention"
DATA_DIRECTORY="C:\ProgramData\Symantec\DataLossPrevention"
```
To install the single-tier server

1. Log on (or remote logon) as Administrator to the computer that is intended for the Symantec Data Loss Prevention single-tier installation.

2. Copy the Symantec Data Loss Prevention installer (SingleTierServer.msi) from DLPDownloadHome to a local directory on the computer where you plan to install the single-tier system.

3. Click Start > Run > Browse to navigate to the folder where you copied the SingleTierServer.msi file.

5. The installer files unpack, and a welcome notice appears. Click Next.

6. In the End-User License Agreement panel, select I accept the terms in the License Agreement, and click Next.

7. In the Destination Folder panel, accept the Symantec Data Loss Prevention default destination directory and click Next.

   Symantec recommends that you use the default destination directory. However, you can click Browse to navigate to a different installation location instead.

   Directory names, account names, passwords, IP addresses, and port numbers created or specified during the installation process must be entered in standard 7-bit ASCII characters only. Extended (hi-ASCII) and double-byte characters are not supported.

8. In the Data Directory panel, accept the default data directory, or enter an alternate directory, and click Next. The default data directory is:

   c:\ProgramData\Symantec\DataLossPrevention\

9. In the JRE Directory panel, accept the default JRE location (or click Browse to locate it), and click Next.

10. In the FIPS Cryptography Mode panel, select whether to disable or enable FIPS encryption.

    About FIPS encryption

11. In the Service User panel, select an existing local or domain user account.

12. Click Next.

13. In the Update User panel, confirm the account name and password.

   This account is used to manage updates sent to the detection server.
14. In the **Oracle Database Server Information** panel, enter the **Oracle Database Server** host name or IP address and the **Oracle Listener Port**.

   **NOTE**
   If you are running the Oracle database in a RAC environment, use the scan host IP address for the host, not the database IP address. Confirm that the scan host IP for RAC is accessible and that all of the nodes associated with it are running during the installation process.

   You also enter information in the following fields:

   | Service Name | Enter the database service name (typically “protect”). |
   | Username     | Enter the Symantec Data Loss Prevention database user name. |
   | Password     | Enter the Symantec Data Loss Prevention database password. |

   Default values should already be present for these fields. Since this is a single-tier installation with the Oracle database on this same system, 127.0.0.1 is the correct value for Oracle Database Server Information and 1521 is the correct value for the Oracle Listener Port.

15. Click **Next**.

16. In the **Additional Locale** panel, select an alternate locale, or accept the default of None, and click **Next**.

   **NOTE**
   Symantec recommends that you use the same locale used in the previous version.

   Locale controls the format of numbers and dates, and how lists and reports are alphabetically sorted. If you accept the default choice of None, English is the locale for this Symantec Data Loss Prevention installation. If you choose an alternate locale, that locale becomes the default for this installation, but individual users can select English as a locale for their use.

   See the *Symantec Data Loss Prevention Administration Guide* for more information on locales.

17. In the **Server Bindings** panel, enter the following settings:

   - **Host**. Enter the host name or IP address of the detection server.
   - **Port**. Accept the default port number (8100) on which the detection server should accept connections from the Enforce Server. If you cannot use the default port, you can change it to any port higher than port 1024, in the range of 1024–65535.

18. Click **Install** to begin the installation process.

   The **Installing** panel appears, and displays a progress bar. After a successful installation, the **Completing** panel displays.

   **Verifying a single-tier installation**

20. If you have not done so already, run the Upgrade Readiness tool to confirm that the Oracle database is ready to be migrated to the new instance. If you have already run the Upgrade Readiness tool, skip this step.

**Running the Migration Utility on single-tier installation**

After you install the 15.7 single-tier system, you can migrate data using the Migration Utility.

   **NOTE**
   If you are running Oracle 19c, update the `Schema_Objects_Validation_b.sql` before you run the Migration Utility. See Update the `Schema_Objects_Validation_b.sql` file if running Oracle 19c.
Before you start the migration, use the Upgrade Readiness tool to confirm that the Oracle database is ready for migration. See Checking the database update readiness.

You can complete the migration silently or using interactive mode.

Migrate data silently

Migrate data using interactive mode

Migrate data silently
To migrate data from a previous single-tier installation version to version 15.7 silently

Run the following command in an elevated command prompt:

```
SingleTierServerMigrationUtility
  -silent
  -sourceVersion="previous version"
```

Where previous version represents the previous, active version (for example, use `-sourceVersion=15.5` to migrate from Symantec Data Loss Prevention version 15.5).

Migrate data using interactive mode
To migrate data from a previous single-tier installation version to version 15.7 using interactive mode

1. Log on (or remote logon) as Administrator to the Single Tier Server system where you intend to run the Migration Utility.

2. Use the command prompt to navigate to the following directory:

   `C:\Program Files\Symantec\DataLossPrevention\SingleTierServer\15.7\Protect\Migrator`

4. Select the active Symantec Data Loss Prevention version to migrate and press Enter.

   The Migration Utility stops services on the previous Symantec Data Loss Prevention version and migrates data, configuration, and custom files to the new version. When the process completes a message displays indicating that the migration has finished.

   **NOTE**

   The previous version is still installed but all services are in a disabled state. If you uninstall the previous version, the service_user is removed.

5. If migration fails, review the Enforce Server migration logs in the `MigrationUtility.log` located at `C:\ProgramData\Symantec\DataLossPrevention\SingleTierServer\15.7\logs\debug`.

Verifying that the Enforce Server and the detection servers are running

Verify that the Enforce Server is running.

Check that all of the detection servers to be upgraded are running the appropriate Symantec Data Loss Prevention version.

1. Log on to the Enforce Server.

2. Go to System > Servers and Detectors > Overview and check that the Symantec Data Loss Prevention servers are running.

Related Links
Applying the updated configuration to Endpoint Prevent servers

The upgrade process updates existing Endpoint Prevent agent configurations with new settings. After you complete the upgrade, the Enforce Server administration console reports that existing Endpoint Servers use an outdated configuration. Follow this procedure to apply the updated agent configuration to your Endpoint Servers.

1. Log on to the Enforce Server administration console using the Administrator account.
2. Select System > Agents > Agent Configuration.
3. Select Apply Configuration.
4. Select all available configurations, and then click Apply and Update.
5. Click Done.

Upgrading your scanners

If you have any version 14.0 or earlier scanners, you should upgrade them to Symantec Data Loss Prevention version 15.7 scanners. To upgrade a scanner, remove the older software and then install the Symantec Data Loss Prevention 15.7 scanner.

For information on adding and removing scanners, see the Symantec Data Loss Prevention Administration Guide available at Related Documents.

Symantec Data Loss Prevention upgrade phases

Upgrading Endpoint Prevent group directory connections

Symantec Data Loss Prevention provides server-side group-based policies, which require an index for each group directory connection that you use. If you have existing Endpoint Prevent group directories from a previous Symantec Data Loss Prevention version, you must create indexes and configure the indexing schedule for those group directories before associated group-based policies can be applied to detection servers.

See the Symantec Data Loss Prevention System Administration Guide for information about creating group directory connections and scheduling directory server indexing available at Related Documents.

Upgrading WinPcap or installing Npcap for Network Monitor

WinPcap or Npcap is required for the Network Monitor detection server on Windows platforms. (WinPcap or Npcap is also recommended for any type of Windows-based detection server you deploy.) For Symantec Data Loss Prevention 15.7, you must use WinPcap version 4.1.3, or Npcap.

**NOTE**

Npcap is added as an alternative to WinPcap for Network Monitor. You can use either WinPcap or Npcap for Network Monitor in Symantec Data Loss Prevention version 15.7

To upgrade your version of WinPcap, use the WinPcap_4.1.x.exe installer. On the Internet, go to the following URL:
http://www.winpcap.org/archive/

1. Download Npcap from https://nmap.orgnpcap.
2. Run the ncap-<version>.exe file.
4. Click install.

Updating an appliance

You update appliance software using the Enforce Server administration console.

For steps to update an appliance, see the Symantec Data Loss Prevention Administration Guide available at Related Documents.
Upgrading Symantec DLP Agents

About Symantec Data Loss Prevention Agent upgrades
You can upgrade DLP Agents from one version to another by using a systems management software, or you can update the agents manually. Manual upgrades are not recommended for large deployments. You can upgrade DLP Agents as a group if you upgrade using systems management software. If you upgrade the agents manually, you must upgrade each agent individually.

NOTE
You cannot run a version 12.x DLP Agent with a 15.7 Endpoint Server. Endpoint Servers are backward-compatible with a DLP Agent for one full release. For example, a version 15.7 Endpoint Server and a version 14.x DLP Agent are compatible.

Symantec recommends installing antivirus software on your endpoints. However, antivirus software may interrupt the DLP Agent upgrade if antivirus scans are being performed on agent installation directories. Therefore, pause antivirus scans on agent installation directories during the upgrade process.

After you upgrade agents to the latest version, each agent must reconnect to the Endpoint Server before detection resumes. The upgrade process deletes all stored policy configurations from the agents. After the agents reconnect to an Endpoint Server, the agents download the relevant policies.

The following table provides a general overview of the upgrade process:

Table 13: Upgrade process for Symantec DLP Agents

About secure communications between DLP Agents and Endpoint Servers

Symantec Data Loss Prevention supports mutual authentication and secure communications between DLP Agents and Endpoint Servers using SSL certificates and public-key encryption.

Symantec Data Loss Prevention sets up a root Certificate Authority (CA) on installation or upgrade. The DLP Agent initiates connections to one of the Endpoint Servers or load balancer servers and authenticates the server certificate. All certificates used for agent to server communications are signed by the Symantec Data Loss Prevention CA.

Symantec Data Loss Prevention automatically generates the SSL certificates and keys needed for authentication and secure communications between DLP Agents and Endpoint Servers. You use the Enforce Server administration console to generate the agent certificate and keys. The system packages the agent certificates and keys with the agent installer for deployment of DLP Agents.

- Working with endpoint certificates on page 48

Generating agent installation packages

You use the System > Agents > Agent Packaging screen to generate the installation package for DLP Agents. You can use the screen to create an installation package that includes the DLP Agent.

About secure communications between DLP Agents and Endpoint Servers

The packaging process creates a zip file that contains the installer of your choosing. The zip file includes public certificate and keys and installation scripts to install DLP Agents. You generate a single installation package for each endpoint platform where you want to deploy.

For example, if you want to install DLP Agents on Windows 64-bit endpoints, you generate a single AgentInstaller_Win64.zip package. If you specify more than one installer for packaging, such as the Windows 64-bit agent installer and the Mac 64-bit agent installer, the system generates separate agent packages for each platform.

NOTE

If you plan to install the ICT Clients and ICE Utilities, you use the System > Agents > Agent Packaging screen to generate installers. Symantec Data Loss Prevention version 15.7 supports packaging version 15.1 MP2 and 15.5 MP3 ICT Clients and ICE Utilities with the DLP Agent.

See the topic “Generating agent installation packages” in the version 15.5 Symantec Data Loss Prevention Upgrade Guide available at Related Documents.

Before you start generating the agent installation packages confirm that your system is ready to package by completing the following:

• Confirm that the agent installers are copied to the Enforce Server local file system.
• Confirm that the Enforce Server has at least 3 GB of free space. The packaging process fails if the Enforce Server has less than 3 GB of free space.

Generating the agent installation package provides instructions for generating agent installation packages. The instructions assume that you have deployed an Endpoint Server.
### Table 14: Generating the agent installation package

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Navigate to the Agent Packaging page.</td>
<td>Log on to the Enforce Server administration console as an administrator and navigate to the System &gt; Agents &gt; Agent Packaging page.</td>
</tr>
</tbody>
</table>
| 2    | Select the agent version. | Select an item in the Select the agent version list that matches the agent installer files you plan to package. You can select one of the following:  
- **Pre-version 15.0**  
  Applies to agent versions 12.5.x through 14.6.x.  
- **Version 15.0**  
  Applies to agent version 15.0.x.  
- **Version 15.1 and later**  
  Applies to all agent versions starting with 15.1.  
You must select 32- and 64-bit installation files that match the agent version you selected. For example, selecting a version 15.0 32-bit and a version 15.7 64-bit installation file while selecting Version 15.1 and later in the list is unsupported. Selecting mis-matched versions prevents agents from installing on endpoints. If you plan to package an ICT Client and ICE Utility with the DLP agent, you must select Version 15.1 and later. Add the DLP Agent, ICT Client and ICE Utility installer files to a ZIP file. You browse for this ZIP file in the next step. |
| 3    | Select one or more DLP Agent installation files. | Browse to the folder on the Enforce Server where you copied the agent installer files:  
Windows 64-bit: AgentInstall-x64_15_7.msi  
Windows 32-bit: AgentInstall-x86_15_7.msi  
Mac 64-bit: AgentInstall_15_7.pkg |
| 4    | Enter the server host name. | Typically you enter the common name (CN) of the Endpoint Server host, or you can enter the IP address of the server. Be consistent with the type of identifier you use (CN or IP). If you used the CN for the Endpoint Server when deploying it, use the same CN for the agent package. If you used an IP address to identify the Endpoint Server, use the same IP address for the agent package. Alternatively, you can enter the CN or IP address of a load balancer server. |
| 5    | Enter the port number for the server. | The default port is 10443. Typically you do not need to change the default port unless it is already in use or intended for use by another process on the server host. |
| 6    | Add additional servers (optional). | Click the plus sign to add additional servers for failover.  
**Note:** Symantec Data Loss Prevention allots 2048 characters for Endpoint Server names. This allotment includes the characters that are used for the Endpoint Server name, port numbers, and semicolons to delimit each server. The first server that is listed is the primary; additional servers are secondary and provide backup if the primary is down. |
| 7    | Enter the Endpoint tools password. | A password is required to use the Endpoint tools to administer DLP Agents. The Endpoint tools password is case-sensitive. The password is encrypted and stored in a file on the Enforce Server. You should store this password in a secure format of your own so that it can be retrieved if forgotten. After installing agents, you can change the password on the Agent Password Management screen.  
**About agent password management** |
<p>| 8    | Re-enter the Endpoint tools password. | The system validates that the passwords match and displays a message if they do not. |</p>
<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
</table>
| 9    | Enter the target directory for the agent installation (Windows only). | The default installation directory for Windows 32- and 64-bit agents is \%PROGRAMFILES\%\Manufacturer\Endpoint Agent. Change the default path if you want to install the Windows agent to a different location on the endpoint host. You can only install the DLP Agent to an ASCII directory using English characters. Using non-English characters can prevent the DLP Agent from starting and from monitoring data in some scenarios.  
**Note:** Include the drive letter if you plan to change the default directory. For example, use C:\Endpoint Agent. Not including a drive letter causes the agent installation to fail.  
The target directory for the Mac agent is set by default. |
| 10   | Enter the uninstall password (optional, Windows only). | The agent uninstall password is supported for Windows agents. The uninstall password is a tamper-proof mechanism that requires a password to uninstall the DLP Agent.  
The password is encrypted and stored in a file on the Enforce Server. You should store this password in a secure format of your own so that it can be retrieved if forgotten.  
After installing agents, you can change the password on the Agent Password Management screen.  
**About agent password management** |
| 11   | Re-enter the uninstall password. | The system validates that the passwords match and displays a message if they do not. |
| 12   | (Optional) Select Install the Symantec ICT Client. | Select this option to package a version 15.1 or 15.5 ICT Client with the agent package.  
Enter the License and ICT Web Service URL.  
Go to the Information Centric Tagging Administration Console to gather information for the following fields:  
- **License**  
  After the ICT admin installs the ICT server and uploads a license file on the Server Keys tab, a server public key displays. Enter that key in the License field.  
- **ICT Web Service URL**  
  The ICT admin defines this URL on the Encryption tab, in the URL of Rights Template Manager Web Services field. Enter that URL in the ICT Web Service URL field. |
| 13   | (Optional) Select Install the Symantec ICE Utility. | Select this option to package a version 15.1 or 15.5 ICE Utility with the agent package.  
**Note:** You must install the ICE Utility before you enable the Enable Information Centric Encryption option on the Agent Configuration > Settings screen on the Enforce Administration console.  
**Note:** For more information, see Information Centric Encryption settings for DLP Agents. |
| 14   | Click Generate Installer Packages. | This action generates the agent installer package for each platform that you selected in step 3.  
The generation process may take a few minutes. |
<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>15</td>
<td>Save the agent package zip file.</td>
<td>When the agent packaging process is complete, the system prompts you to download the agent installation package. Save the zip file to the local file system. After you save the file you can navigate away from the Agent Packaging screen to complete the process. The zip file is named according to the agent installer you uploaded: AgentInstaller_Win64.zip, AgentInstaller_Win32.zip, AgentInstaller_Mac64.zip. If you upload more than one agent installer, the package name is AgentInstallers.zip. In this case, the zip file contains separate zip files for each agent package for each platform you selected in step 3.</td>
</tr>
<tr>
<td>16</td>
<td>Install DLP Agents using the agent package.</td>
<td>Once you have generated and downloaded the agent package, you use it to install all agents for that platform.</td>

### Working with endpoint certificates

Symantec Data Loss Prevention automatically generates the public certificates and the keys needed for authentication and secure communications between DLP Agents and Endpoint Server. The public certificates and keys are securely stored in the Enforce Server database.

When you install or upgrade the Enforce Server, the system generates the DLP root certificate authority (CA). This file is versioned and the version is incremented if the file is regenerated. You can view which CA version is currently in use at the **System > Settings > General** screen. The password for the DLP root CA is randomly generated and used by the system. Changing the root CA password is reserved for internal use.

When you deploy an Endpoint Server, the system generates the server public-private key pair signed by the DLP root CA certificate. These files are versioned. When you generate the agent package, the system generates the agent public-private key pair and the agent certificate, also signed by the DLP root CA.

### Process to upgrade the DLP Agent on Windows

You can upgrade one DLP Agent to a Windows endpoint at a time, or you can use system management software (SMS) to upgrade many DLP Agents automatically. Symantec recommends that you upgrade one DLP Agent using the manual method before you upgrade many DLP Agents using your SMS. Upgrading in this manner helps you troubleshoot potential issues and ensure that upgrading using your SMS goes smoothly.

Before you upgrade DLP Agents on Windows endpoints, confirm that you have completed prerequisite steps. [About Symantec Data Loss Prevention Agent upgrades](#)

#### Table 17: Process to upgrade agents on Windows endpoints

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<td>Upgrade the agent. Upgrade an agent manually. You can upgrade an agent manually when you want to test the configuration. Upgrade the agents using your SMS. You upgrade agents using this method to upgrade many agents at one time.</td>
<td>Upgrading the Windows agent manually Upgrading the Windows agent silently</td>
</tr>
</tbody>
</table>
Upgrading previous version DLP Agents with Windows Safe Mode monitoring enabled

If you are upgrading DLP Agents from 12.5.x or 14.0.x with Safe Mode monitoring enabled to 15.7, you must delete the registry entries for the TDI drivers before you upgrade the agents.

Locate and delete the following TDI registry entries on each endpoint with Safe Mode monitoring enabled:

```
[HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\SafeBoot\Minimal\tdifdvvv.sys]
```

For the file `tdifdvvv.sys`, replace `vvvv` with the DLP Agent version. For example, DLP Agent version 12.5.2 would display as `tdifd1252.sys`.

Upgrading the Windows agent manually

You can upgrade DLP Agents manually on your endpoints by using the `upgrade_agent.bat` file. Under normal circumstances, you upgrade DLP Agents manually when you troubleshoot or test DLP Agents in your implementation.

These steps assume that you have generated the agent installation package. See Generating agent installation packages.

1. Run the DLP Agent upgrade batch file.
   
   You run the `upgrade_agent.bat` located in the agent installation package ZIP file. The user running the batch file must have administrator rights.

2. Confirm that the agent is running.
   
   Once installed, the DLP Agent initiates a connection with the Endpoint Server. Confirm that the agent is running by going to Agent > Overview and locating the agent in the list.

Upgrading the Windows agent silently

You can upgrade DLP Agents silently using a systems management software (SMS) product. Symantec recommends that you use the `upgrade_agent.bat` package to upgrade agents. You must upgrade agents from a local directory. If you do not upgrade from a local directory, some functions of the DLP Agent are disabled.

   **NOTE**

   These steps assume that you have generated the agent installation package. See Generating agent installation packages.

1. In your SMS package, specify the `upgrade_agent.bat` package.
   
   **NOTE**

   Do not rename the `upgrade_agent.bat` file for any reason. If you rename this file, your systems management software cannot recognize the file and the installation fails.

2. Specify the `upgrade_agent.bat` installation properties.

   When you install the Symantec DLP Agent, your systems management software issues a command to the specified endpoints. The following is an example of what the command might look like:

   ```
   msiexec /i InstallAgent.bat /q INSTALLDIR="C:\Program Files\Manufacturer\Symantec DLP Agent\"
   ARPSYSTEMCOMPONENT="1" ENDPOINTSERVER="epserver1:8001;epserver2:8001" SERVICENAME="ENDPOINT"
   WATCHDOGNAME="WATCHDOG" UNINSTALLPASSWORDKEY="password" TOOLS_KEY="<tools key password>"
   ENDPOINT_CERTIFICATE="endpoint_cert.pem" ENDPOINT_PRIVATEKEY="endpoint_priv.pem"
   ENDPOINT_TRUSTSTORE="endpoint_truststore.pem" ENDPOINT_PRIVATEKEY_PASSWORD="<endpoint private key password>" VERIFY_SERVER_HOSTNAME="No" STARTSERVICE="Yes" ENABLEWATCHDOG="YES" LOGDETAILS="Yes" /log C:\installAgent.log
   ```
The following table outlines each command and what it does.

<table>
<thead>
<tr>
<th>Command</th>

</tbody>
</table>

3. Specify the msiexec properties.

For details on entering this information into your particular systems management software, see the software product documentation.

After you upgrade the agents, the DLP Agent service automatically starts on each endpoint computer. Log on to the Enforce Server and go to System > Agents > Overview, then locate the upgraded agent. Verify that the newly upgraded agent is registered by the confirming that the latest version displays in the list.

### Process to upgrade the DLP Agent on Mac

You can upgrade one DLP Agent to a Mac endpoint at a time, or you can use system management software (SMS) to upgrade many DLP Agents automatically. Symantec recommends that you upgrade one DLP Agent using the manual method before you upgrade many DLP Agents using your SMS. Upgrading in this manner helps you troubleshoot potential issues and ensure that upgrading using your SMS goes smoothly.

Before you upgrade DLP Agents on Mac endpoints, confirm that you have completed prerequisite steps. About Symantec Data Loss Prevention Agent upgrades

Packaging Mac agent upgrade files

You use the create_package tool to bundle the Mac agent upgrade-related files into a single package. You place this package in your SMS software to perform a silent upgrade. You also use the create_package tool to assign a package ID and to bundle endpoint tools with the agent upgrade.

The following steps assume that you have generated the agent installation package and completed all prerequisites.

About secure communications between DLP Agents and Endpoint Servers

1. Locate the AgentInstaller_Mac64.zip agent installation package. Unzip the contents of this file to the folder on a Mac endpoint, for example, /tmp/MacInstaller.

   **NOTE**
   If you are running macOS 10.15.x and later, unzip the file contents to the /tmp/MacInstaller folder. macOS 10.15.x and later prevents the create_package tool from running from default folder locations (for example, Downloads, Documents, Applications, and so on).

   **Agent installation package contents**

2. Use the Terminal.app to bundle the Mac agent upgrade-related file by running the following commands:

   ```
   $ cd /tmp/MacInstaller
   $ ./create_package
   -i <com.company.xyz> (Optional) Includes a custom package identifier.
   You can register the DLP Agent installer receipt data with a custom package identifier. Replace <com.company.xyz> with information specific to your deployment.
   -t ./Tools (Optional) Calls the create_package tool to bundle the agent tools.
   The following is an example of what the completed command might look like:
   ```

   ```
   $ cd /tmp/MacInstaller; $ ./create_package; -i <com.company.xyz>; -t ./Tools
   ```

   After you execute the command, a message displays the package creation status.

   A file that is named AgentInstall_WithCertificates.pkg is created in the location you indicated. Based on the example, AgentInstall_WithCertificates.pkg is created at /tmp/MacInstaller.

3. (Optional) If you opted to register the DLP Agent with a custom package identifier, verify the custom package identity. Execute the following command:

   ```
   $ pkgutil --pkg-info <com.company.xyz>
   Replace com.company.xyz with information specific to your deployment.
   ```

**About optional installation and maintenance tools**

You can opt to include installation and maintenance tools with the Mac agent installation package. After the agent installs, administrators can run these tools on Mac endpoints.

The installation and maintenance tools can be found in the Symantec_DLP_15.7_Agent_Mac-IN.zip file.

See "About Endpoint tools" in the Symantec Data Loss Prevention Administration Guide available at Related Documents.

Place tools you want to include in the PKG in the same directory where the PKG file is located: /tmp/MacInstaller.

**Packaging Mac agent upgrade files**

**Table 19: Mac agent maintenance tools** lists the available tools.
Table 19: Mac agent maintenance tools

<table>
<thead>
<tr>

<th>Description</th>
</tr>
</thead>
</table>
| Maintenance | • vontu_sqlite3 lets you inspect the agent database.  
• logdump creates agent log files. |

Upgrading the DLP Agent for Mac manually

Instructions for installing the DLP Agent on a Mac endpoint provides steps for upgrading the DLP Agent for Mac manually.

Normally you perform a manual installation or upgrade when you want to test the agent installation package. If you do not plan to test the agent installation package, you install Mac agents using an SMS. Upgrading DLP Agents on Mac endpoints silently

**NOTE**

The following steps assume that you have generated the agent installation package and completed all prerequisites. About secure communications between DLP Agents and Endpoint Servers

Table 20: Instructions for upgrading the DLP Agent on a Mac endpoint

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
</table>
| 1    | Locate the agent installation package ZIP (AgentInstaller_Mac64.zip), and unzip it to the Mac endpoint. | Unzip the file to /tmp/MacInstaller.  
Symantec recommends that you unzip the file contents to the /tmp/MacInstaller folder if you are running macOS 10.15.x and later. macOS prevents the `create_package` tool from running at locations like Downloads, Documents, and etc. |
| 2    | Upgrade the Mac Agent from the command line using the Terminal application. | Run the following command on the target endpoint:  
$ sudo installer -pkg /tmp/MacInstaller/AgentInstall_15_7.pkg -target /  
Replace /tmp/MacInstaller with the path where you unzipped the agent installation package. |
| 3    | Verify the Mac agent upgrade. | To verify the Mac agent installation, open the Activity Monitor and search for the `edpa` process. It should be up and running.  
The Activity Monitor displays processes being run by logged on user and edpa runs as root. Select View All Processes to view edpa if you are not logged on as root user.  
You can also confirm that agent was installed to the default directory: /Library/Manufacturer/Endpoint Agent. |
| 4    | (Optional) Troubleshoot the upgrade. | If you experience upgrade issues, use the Console application to check the log messages.  
Review the Mac Agent installer logs at /var/log/install.log.  
In addition, you can rerun the installer with -dumplog option to create detailed installation logs. For example, use the command sudo installer -pkg /tmp/AgentInstall/AgentInstall_15_7.pkg -target / -dumplog.  
Replace /tmp/MacInstaller with the path where you unzipped the agent installation package. |
| 5    | (Optional) Review information about the Mac agent installation. | What gets upgraded for DLP Agents on Mac endpoints |
Upgrading DLP Agents on Mac endpoints silently

You can use a silent installation process by using systems management software (SMS) to upgrade DLP Agents to endpoints. You must always install the agent installation package from a local directory. If you do not install from a local directory, some functions of the DLP Agent are disabled.

These steps assume that you have generated the agent installation package and packaged the Mac agent installation files.

Generating agent installation packages

Packaging Mac agent upgrade files

1. Enable the SMS client on the Mac endpoints.
2. Obtain root user access to the Mac endpoints.
3. Specify the `AgentInstall_WithCertificates.pkg` package in your systems management software.
4. Specify a list or range of network addresses where you want to upgrade the DLP Agent.
5. Start the silent upgrade process.

**NOTE**

If messages indicate that the process failed, review the `install.log` file that is located in the `/tmp` directory on each Mac endpoint.

Confirming that the Mac agent is running

To verify that the Mac agent is running, open the Console application and locate the launchd service. The launchd service is deployed during the agent installation and begins running after the installation completed.

Launchd is the service that automatically restarts the agent daemon if an endpoint user stops or kills the agent. Users cannot stop the launchd service on their workstations. Preventing users from stopping the launchd service allows the DLP Agent to remain active on the endpoint.

You can also confirm that the `com.symantec.dlp.edpa` service is running. This service displays pop-up notifications on the Mac endpoint.

Post-upgrade tasks

Learn about tasks you can perform after upgrading Symantec Data Loss Prevention.

Performing post-upgrade tasks
Verifying Symantec Data Loss Prevention operations
Enabling Microsoft Rights Management file monitoring
Migrating plug-ins
About securing communications between the Enforce Server and the database
About remote indexers
About updating the JRE to the latest version

Performing post-upgrade tasks

You must perform certain tasks after you finish upgrading.

Verifying Symantec Data Loss Prevention operations

Symantec Data Loss Prevention upgrade phases

Verifying Symantec Data Loss Prevention operations

Verify that Symantec Data Loss Prevention operates correctly by performing some checks.

1. Log on to the Enforce Server administration console as Administrator.
2. Log out of the Enforce Server administration console and then log on as a user other than Administrator.
3. Go to the System Overview screen and recycle the current version detection servers to verify that they are connected.
4. Click on each heading in the Enforce Server navigation pane to view the data that was carried over from the previous version.
5. Verify that any reports that you had saved from your previous version are still there.
6. Send test emails to trigger a few existing policies and then run a traffic report to confirm that the test messages generated incidents.
7. Network Discover provides incremental scanning for certain target types. After you upgrade Symantec Data Loss Prevention, verify that incremental scanning is configured for valid targets. See the Symantec Data Loss Prevention System Administration Guide at Related Documents for information about configuring incremental scans available.
8. If you have deployed any Lookup plug-ins, go to the System > Lookup Plugins screen and verify that the plug-in appears in the list of plug-ins and is configured correctly.
9. Check the Events screen for any severe events.

For more information on performing these procedures, see the Symantec Data Loss Prevention Administration Guide available at Related Documents.
Enabling Microsoft Rights Management file monitoring

Symantec Data Loss Prevention can detect files that are encrypted using Microsoft Rights Management (RMS) administered by Azure or Active Directory (AD).

Before you enable Microsoft Rights Management file monitoring, confirm that prerequisites for the RMS environment and the detection server have been completed. About Microsoft Rights Management file and email monitoring

Enabling RMS detection for Azure-managed RMS

For Azure RMS, complete the following on each detection server to enable RMS file monitoring:

1. Locate the plugin Enable-Plugin.ps1 located on the detection server at the following path:

   C:\Program Files\Symantec\DataLossPrevention\ContentExtractionService\15.7\Protect\plugins\contentextraction\MicrosoftRightsManagementPlugin\
   
2. Run the plugin by executing the following command:

   powershell.exe -ExecutionPolicy RemoteSigned -File "C:\Program Files\Symantec\DataLossPrevention\ContentExtractionService\15.7\Protect\plugins\contentextraction\MicrosoftRightsManagementPlugin\Enable-Plugin.ps1"

3. Run the configuration utility ConfigurationCreator.exe to add the system user. Run the utility as the protect user.

   **NOTE**
   Enter all credentials accurately to ensure that the feature is enabled.

   C:\Program Files\Symantec\DataLossPrevention\ContentExtractionService\15.7\Protect\plugins\contentextraction\MicrosoftRightsManagementPlugin\ConfigurationCreator.exe
   Do you want to configure ADAL authentication [y/n]: n
   Do you want to configure symmetric key authentication [y/n]: y
   Enter your symmetric key (base-64): [user's Azure RMS symmetric key]
   Enter your app principal ID: [user's Azure RMS app principal ID]
   Enter your BPOS tenant ID: [user's Azure RMS BPOS tenant ID]

   After running this script, the following files are created in the MicrosoftRightsManagementPlugin at \Program Files\Symantec\DataLossPrevention\ContentExtractionService\15.7\Protect\plugins\contentextraction:\

   • rightsManagementConfiguration
   • rightsManagementConfigurationProtection

4. Restart each detection server to complete the process.

   **NOTE**
   You can confirm that Symantec Data Loss Prevention is monitoring RMS content by reviewing the ContentExtractionHost_FileReader.log file (located at \ProgramData\Symantec\DataLossPrevention\DetectionServer\15.7\protect\Logs\debug). Error messages that display for the MicrosoftRightsManagementPlugin.cpp item indicate that the plugin is not monitoring RMS content.
Enabling RMS detection for AD-managed RMS

For AD RMS, complete the following on each detection server to enable RMS file monitoring:

1. Run the plugin, `Enable-Plugin.ps1`, which is located at `\Program Files\Symantec\DataLossPrevention\Protect\bin` on the Enforce Server.
   ```powershell
   powershell.exe -ExecutionPolicy RemoteSigned -File "C:\Program Files\Symantec\DataLossPrevention\ContentExtractionService\15.7\Protect\plugins\contentextraction\MicrosoftRightsManagementPlugin\Enable-Plugin.ps1"
   ``

2. Restart each detection server to complete the process.

   **NOTE**
   You can confirm that Symantec Data Loss Prevention is monitoring RMS content by reviewing the `ContentExtractionHost_FileReader.log` file (located at `\ProgramData\Symantec\DataLossPrevention\DetectionServer\15.7\protect\Logs\debug`). Error messages that display for the `MicrosoftRightsManagementPlugin.cpp` item indicate that the plugin is not monitoring RMS content.

Migrating plug-ins

During the upgrade process, the Migration Utility moves plug-ins from the previous version system to the new system location: `\Program Files\Symantec\DataLossPrevention\EnforceServer\15.7\Protect\plugins`. Specifically, the following plug-ins are migrated:

- `FileShare\plugin_settings`
- `MicrosoftRightsManagementPlugin\rightsManagementConfiguration`
- `MicrosoftRightsManagementPlugin\rightsManagementConfigurationProtection`
- `contentextraction\MarkupTestPlugin`

The Migration Utility does not move plug-ins in other locations, custom plug-ins, custom scripts, previous version log files, or JAR files to the new version system location. You manually copy these files to the new location.

1. Locate the files you plan to move.

   Most plug-ins and scripts are stored at `SymantecDLP\Protect\plugins` on the previous version system.

2. Copy the files to the following locations on the new version system:

   - **Enforce Server**: `\Program Files\Symantec\DataLossPrevention\EnforceServer\15.7\Protect\plugins`
   - **Detection server**: `\Program Files\Symantec\DataLossPrevention\DetectionServer\15.7\Protect\plugins`

About securing communications between the Enforce Server and the database

You can use Transport Layer Security (TLS) to encrypt all data that is transmitted between the Enforce Server and the database server in a three-tier environment. You create unique, self-signed certificates that you store on the Enforce Server.

You must upgrade Symantec Data Loss Prevention before you secure communications between the Enforce Server and the database using TLS. The Symantec Data Loss Prevention upgrade cannot communicate over TLS.

**Table 22: Steps to secure communications between the Enforce Server and the database** describes the process to secure communications between the Enforce Server and the database.
### Table 22: Steps to secure communications between the Enforce Server and the database

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>

### About orapki command line options

You use the orapki command-line utility to create a wallet where certificates are stored. You then use the utility to generate a unique pair of TLS self-signed certificates that are used to secure communication between the Enforce Server and the Oracle database.

The orapki utility can be found in the `%ORACLE_HOME%\bin` folder where the Oracle database is located. You run the orapki utility on the computer where the Oracle database is located.

**Table 23: Orapki utility examples** lists the command forms and options that you use when generating a unique pair of TLS self-signed certificates.

### Table 23: Orapki utility examples

<table>
<thead>
<tr>
<th>Command and options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>orapki wallet create -wallet c:\oracle\wallet\server_wallet -auto_login -pwd password</td>
<td>You use this command to create a wallet where certificates are stored. This command also creates the <code>server_wallet</code> directory.</td>
</tr>
<tr>
<td>orapki wallet add -wallet c:\oracle\wallet\server_wallet -dn &quot;CN=oracleserver&quot; -keysize 2048 -self_signed -validity 3650 -pwd password -sign_alg sha256</td>
<td>You use this command to add a self-signed certificate and a pair of private/public keys to the wallet.</td>
</tr>
<tr>
<td>orapki wallet display -wallet c:\oracle\wallet\server_wallet</td>
<td>You use this command to view the contents of the wallet to confirm that the self-signed certificate was created successfully.</td>
</tr>
<tr>
<td>orapki wallet export -wallet c:\oracle\wallet\server_wallet -dn &quot;CN=oracleserver&quot; -cert c:\oracle\wallet\server_wallet\cert.txt</td>
<td>You use this command to export the self-signed certificate. In addition to exporting the certificate files, the command creates the file <code>cert.txt</code> in the <code>c:\oracle\wallet\server_wallet</code> directory.</td>
</tr>
</tbody>
</table>

### Using orapki to generate the server certificate on the Oracle database

Complete the following steps to generate the server certificate on the Oracle database.

1. Shut down all Oracle services if they are running in Windows Services.
   - To view the services go to **Start > Control Panel > Administrative Tools > Computer Management**, and then expand **Services and Applications** and click **Services**.
2. Go to the `oracle` directory by running the following command:
   ```
   cd c:\oracle
   ```
3. Create the wallet directory by running the following command:
   ```
   mkdir wallet
   ```
4. Create a wallet on the Oracle server with auto login enabled by running the following command in the `c:\oracle\wallet` directory:

   ```
   orapki wallet create -wallet .\server_wallet -auto_login -pwd walletpassword
   ```

   **NOTE**
   Use a wallet password that adheres to the password policy. Passwords must have a minimum length of eight characters and contain alphabetic characters combined with numbers or special characters.

   On Oracle 12c systems, the **Operation is successfully completed** message displays when the command completes.

   The following two files are created under the `server_wallet` directory (among similarly named `.lck` files):
   - `cwallet.sso`
   - `ewallet.p12`

5. Generate the self-signed certificate and add it to the wallet by running the following command:

   ```
   orapki wallet add -wallet c:\oracle\wallet\server_wallet -dn "CN=oracleserver" -keysize 2048 -self_signed -validity 3650 -pwd walletpassword -sign_alg sha256
   ```

   Replace `oracleserver` with the name of the computer where Oracle is running.

6. View the wallet to confirm that the certificate was created successfully by running the following command:

   ```
   orapki wallet display -wallet c:\oracle\wallet\server_wallet
   ```

   When the certificate is created successfully, the command returns information in the following form:

   ```
   Requested Certificates:
   User Certificates:
   Subject:        CN=oracleserver
   Trusted Certificates:
   Subject:        CN=oracleserver
   ```

7. Export the certificate by running the following command:

   ```
   orapki wallet export -wallet c:\oracle\wallet\server_wallet -dn "CN=oracleserver" -cert c:\oracle\wallet\server_wallet\cert.txt
   ```

8. Confirm that `cert.txt` is created at the following location:

   ```
   c:\oracle\wallet\server_wallet
   ```

### Configuring communication on the Enforce Server

After you generate the server certificate on the Oracle database, you update the `listener.ora` file to point to the self-signed certificate.

1. **Back up the `listener.ora` file before you update it.**

   The file is located at `%ORACLE_HOME%\network\admin`.

2. **Switch to the Oracle user by running the following command:**

   ```
   su - oracle
   ```

3. **Stop the listener by running the following command:**

   ```
   lsnrctl stop
   ```

   You can skip this step if the database is already stopped.
4. Open the `listener.ora` file.
5. Update the port number to 2484 and the protocol to TCPS on the **Address** line.

   The **Listener** section should read as follows:

   ```
   LISTENER =
     (DESCRIPTION_LIST =
       (DESCRIPTION =
         (ADDRESS = (PROTOCOL = TCPS)(HOST = [oracle host name])(PORT = 2484))
         (ADDRESS = (PROTOCOL = IPC)(KEY = protect))
       )
     )
   ```

6. Add the following section to follow the **Listener** section:

   ```
   NOTE
   Confirm that the directory points to the server_wallet location.
   ```
   ```
   SSL_CLIENT_AUTHENTICATION = FALSE
   WALLET_LOCATION = (SOURCE = (METHOD = FILE) (METHOD_DATA = (DIRECTORY =c:\oracle\wallet\server_wallet)))
   ```

7. Navigate to the directory `$ORACLE_HOME/network/admin` and open the `sqlnet.ora` file. Create a new `sqlnet.ora` file if it does not exist.

8. Navigate to the directory `%ORACLE_HOME%\network\admin` and open the `sqlnet.ora` file. Create a new `sqlnet.ora` file if it does not exist.

9. Replace the line `SQLNET.AUTHENTICATION_SERVICES=(TNS)` with the following:

   ```
   SQLNET.AUTHENTICATION_SERVICES=(NONE)
   SSL_CLIENT_AUTHENTICATION = FALSE
   WALLET_LOCATION = (SOURCE = (METHOD = FILE) (METHOD_DATA = (DIRECTORY =c:\oracle\wallet\server_wallet)))
   ```

10. Navigate to the directory `$ORACLE_HOME/network/admin` and open the `tnsnames.ora` file.

11. Update the protocol to TCPS and the port to 2484. The updated content should match the following:

   ```
   PROTECT =
     (DESCRIPTION =
       (ADDRESS = (PROTOCOL = TCPS)(HOST = [oracle host name])(PORT = 2484))
       (CONNECT_DATA =
         (SERVER = DEDICATED)
         (SERVICE_NAME = protect)
       )
     )
   ```

   ```
   LISTENER_PROTECT =
     (ADDRESS = (PROTOCOL = TCPS)(HOST = [oracle host name])(PORT = 2484))
   ```

12. Start all Oracle services.

   To view the services go to **Start > Control Panel > Administrative Tools > Computer Management**, and then expand **Services and Applications** and click **Services**.

13. Start the Oracle database by running the following command:
14. Confirm that the Oracle listener is operating by running the following command:

   lsnrctl status

   The listener status displays in the command prompt.

   If the command prompt indicates that the listener is running but no services are running on the database, run the following commands:

   export ORACLE_SERVICE_NAME=protect

   sqlplus /nolog

   SQL> conn sys/<password> as sysdba

   If Connected to an idle instance displays, run the following command:

   SQL> startup

   SQL> exit

   lsnrctl status

Configuring the server certificate on the Enforce Server

After you configure communication on the Enforce Server, you configure the JDBC driver and the server certificate. You configure the JDBC driver to use the TLS connection and port, then you configure the server certificate.

1. Locate the jdbc.properties file located at C:\Program Files\Symantec\DataLossPrevention\EnforceServer\15.7\protect\config.

2. Modify the following communication port and connection information:

   a) Update the jdbc.dbalias.oracle-thin line to use TCPS.

   b) Change the port number to 2484.

   The updated communication port and connection information should display as follows:

   jdbc.dbalias.oracle-thin=@(description=(address=(host=[oracle host name])
   (protocol=tcps)(port=2484))(connect_data=(SERVICE_NAME=protect))
   (SSL_SERVER_CERT_DN="CN=oracleserver")

   NOTE

   If the server certificate on the Oracle database is signed by a public CA (instead of being self-signed), skip to step 5.

3. Add the certificate to the cacerts file that is located on the Enforce Server by completing the following steps:

   a) Copy the cert.txt file to c:\Program Files\Symantec\DataLossPrevention\ServerJRE\1.8.0_202\lib\security.

   b) Change the directory by running the following command:

      cd c:\Program Files\Symantec\DataLossPrevention\ServerJRE\1.8.0_202\lib\security

   c) Insert the certificate into the cacerts file by running the following command as an administrator:

      keytool -import -alias oracleservercert -keystore cacerts -file cert.txt

      Enter the default password when you are prompted: changeit.

   d) Confirm that the certificate was added by running the following command:

      keytool -list -v -keystore c:\Program Files\Symantec\DataLossPrevention\ServerJRE\1.8.0_202\lib\security\cacerts -storepass changeit
4. Restart all SymantecDLP services.

Verifying the Enforce Server database certificate usage

To confirm that certificates are configured correctly and the Enforce Server is communicating with the database, log on to the Enforce Server administration console. If you can log on, the Enforce Server and database are communicating over a secure communication.

If you cannot log on, confirm the SSL Java application connection. To confirm the SSL Java application connection, check the listener status on the database server. In the listener status, the TCPS protocol and port 2484 should be in use. If the listener status does not display these connection statuses, re-complete the process to generate the self-signed certificates.

For full details on how to configure secure sockets layer authentication, see the following platform-specific documentation from Oracle Corporation, available from the Oracle Documentation Library:

Oracle 12c SE2: https://docs.oracle.com/database/121/DBSEG/asossl.htm#DBSEG070

Related Links

About securing communications between the Enforce Server and the database on page 57

About remote indexers

The process of installing an EMDI, IDM, or EDM remote indexer is similar to installing a detection server, except that you use the Indexers.msi.

See the Symantec Data Loss Prevention Administration Guide at Related Documents for detailed information on installing and using a remote indexer.

About updating the JRE to the latest version

You use the JREMigrationUtility to update the JRE on each server, including the Enforce Server, detection server, indexers, the server that hosts a single-tier environment, and so on. If there is an off-cycle update to the OpenJRE, you can upgrade the JRE.

Steps to update the JRE

Prepare for updating the JRE by completing the following steps:

2. Install the OpenJRE.

   See Installing the OpenJRE for steps to install.

   NOTE

   The latest JRE improves LDAP security. However, the improved security may cause the SSL connection to Microsoft Active Directory to fail. If the SSL connection fails, add the following key to your SymantecDLPManager.conf file, then restart the Enforce Server:

   `wrapper.java.additional.30 =-Dcom.sun.jndi.ldap.object.disableEndpointIdentification=true`
Installing the OpenJRE
These steps apply to Symantec Data Loss Prevention versions 15.1 and later.

1. Complete the following steps for Endpoint Servers where you plan to install OpenJRE.
   Applying this setting allows DLP Agents to connect to the Endpoint Server where the OpenJRE is installed.
   a) Go to System > Servers and Detectors > Overview > Server/Detector Detail screen, and click Server Settings for the Endpoint Server.
   b) Locate the BoxMonitor.EndpointServerMemory setting and enter the following string:
      Djdk.security.allowNonCaAnchor=true.
   c) Save your changes.
   d) Restart the Endpoint Server.

2. Obtain the latest supported version of OpenJRE from https://adoptopenjdk.net/.
   See the Symantec Data Loss Prevention System Requirements and Compatibility Guide available at the Tech Docs Portal.

3. Download the file (in ZIP format) and move it to the Enforce Server and the detection servers.

4. Unzip the file to the JRE directory on the server.
   Symantec recommends that you use the following directory:
   C:\Program Files\AdoptOpenJRE\jdk8u<version>-jre
   The unzipping process completes the installation.

Updating the JRE to the latest version on Windows
During the update process, all Symantec Data Loss Prevention services are shut down and restarted automatically.
You can upgrade the JRE using either of the following modes:

• Interactive mode
  Update the JRE using interactive mode

• Silent mode
  Update the JRE using silent mode

Update the JRE using interactive mode

1. Log in to the Windows system as Administrator.
2. Create a directory called C:\JREMigrationUtility.
3. Move the JREMigrationUtility.zip file to the C:\JREMigrationUtility directory.
5. Open a command prompt and navigate to the C:\JREMigrationUtility\Migrator directory.
6. Execute the following command:
   ServerJREMigrationUtility.exe  -jreDirectory=<JRE directory>
   Where <JRE directory> is the directory where the JRE is located (for example, C:\Program Files\AdoptOpenJRE\jdk8u262-b10-jre).
7. Choose the Symantec Data Loss Prevention version where you are upgrading the JRE. Enter the number corresponding with the version.

8. Press Enter.

   The migration process displays in the command line. You can find the migration log in the C:\JREMigrationUtility\Migrator folder.

**Update the JRE using silent mode**

1. Log in to the Windows system as Administrator.
2. Create directory called JREMigrationUtility.
3. Move the JREMigrationUtility.zip file to the c:\JREMigrationUtility directory.
5. Open a command prompt and navigate to the C:\JREMigrationUtility\Migrator directory.
6. Execute the silent command.

   Silent mode parameters on Windows lists the parameters.

   The following is an example of what the command might look like:

   ```
   c:\JREMigrationUtility\Migrator>ServerJREMigrationUtility.exe -silent -sourceVersion=15.7 -jreDirectory="C:\Program Files\AdoptOpenJRE\jdk8u262-b10-jre"
   ```

**Table 24: Silent mode parameters on Windows**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>-silent</td>
<td>Enables silent mode.</td>
<td>N/A</td>
</tr>
<tr>
<td>-sourceVersion</td>
<td>Identifies the Symantec Data Loss Prevention version for which you want to upgrade the JRE version.</td>
<td>15.1, 15.5, or 15.7</td>
</tr>
<tr>
<td>-jreDirectory</td>
<td>Points to where the JRE installation is located. Use this parameter when you are migrating a JRE that is not provided by Symantec.</td>
<td>For example, C:\Program Files\AdoptOpenJRE\jdk8u262-b10-jre.</td>
</tr>
</tbody>
</table>

**Reverting a JRE version to a previous release**

You can revert the JRE to a previous version. The following steps use [previous_version] to refer to the previous JRE version.

   **NOTE**

   The process to revert the JRE temporarily shuts down then restarts services.

**Reverting the JRE on Windows**

1. Confirm that the Symantec Data Loss Prevention system is running.
2. Confirm that the JRE version you plan to revert to is installed on the Symantec Data Loss Prevention system.
3. Run the following command to point the ServerJREMigrationUtility to the previous JRE:

   ```
   C:\JREMigrationUtility\Migrator>ServerJREMigrationUtility.exe -jreDirectory="<JRE directory>"
   ```
Replace `<JRE directory>` with the directory where the previous JRE is located.

4. Choose the Symantec Data Loss Prevention version where you are upgrading the JRE. Enter the number corresponding with the version.

You can uninstall the unused JRE version, but you are not required to do so.
Starting and stopping services

About Symantec Data Loss Prevention services

About Symantec Data Loss Prevention services
The Symantec Data Loss Prevention services may need to be stopped and started periodically. This section provides a brief description of each service and how to start and stop the services on supported platforms.

The Symantec Data Loss Prevention services for the Enforce Server are described in the following table:

Table 25: Symantec Data Loss Prevention Enforce Server services

<table>
<thead>
<tr>
<th>Service Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Symantec DLP Manager</td>
<td>Provides the centralized reporting and management services for Symantec Data Loss Prevention. See #unique_111/unique_111_Connect_42_task_1.</td>
</tr>
<tr>
<td>Symantec DLP Detection Server Controller</td>
<td>Controls the detection servers.</td>
</tr>
<tr>
<td>Symantec DLP Notifier</td>
<td>Manages communications between other DLP services and prevents transactional conflicts between the services and the database.</td>
</tr>
<tr>
<td>Symantec DLP Incident Persister</td>
<td>Writes the incidents to the database.</td>
</tr>
</tbody>
</table>

Increase the Max Memory
If you have more than 50 policies, 50 detection servers, or 50,000 agents, increase the Max Memory for this service from 2048 to 4096. You can adjust this setting in the SymantecDLPManger.conf file.

1. Open the SymantecDLPManger.conf file in a text editor.
   You can find this configuration file at \Program Files\Symantec\DataLossPrevention\EnforceServer\Services.
2. Change the value of the wrapper.java.maxmemory parameter to 4096.
   wrapper.java.maxmemory = 4096
3. Save and close the file.

**About starting and stopping services on Windows**

The procedures for starting and stopping services vary according to installation configurations and between Enforce and detection servers.

- Starting an Enforce Server on Windows
- Stopping an Enforce Server on Windows
- Starting a detection server on Windows
- Stopping a detection server on Windows
- Starting services on single-tier Windows installations
- Stopping services on single-tier Windows installations

**Starting an Enforce Server on Windows**

Use the following procedure to start the Symantec Data Loss Prevention services on a Windows Enforce Server.

To start the Symantec Data Loss Prevention services on a Windows Enforce Server

1. On the computer that hosts the Enforce Server, navigate to **Start > All Programs > Administrative Tools > Services** to open the Windows Services menu.
2. Start the Symantec Data Loss Prevention services in the following order:
   - SymantecDLPNotifierService
   - SymantecDLPManagerService
   - SymantecDLPIncidentPersistserService
   - SymantecDLPDetectionServerControllerService

   **NOTE**
   
   Start the SymantecDLPNotifierService service first before starting other services.

**Stopping an Enforce Server on Windows**

Use the following procedure to stop the Symantec Data Loss Prevention services on a Windows Enforce Server.

To stop the Symantec Data Loss Prevention services on a Windows Enforce Server

1. On the computer that hosts the Enforce Server, navigate to **Start > All Programs > Administrative Tools > Services** to open the Windows Services menu.
2. From the Services menu, stop all running Symantec Data Loss Prevention services in the following order:
   - SymantecDLPDetectionServerControllerService
   - SymantecDLPIncidentPersistserService
   - SymantecDLPManagerService
   - SymantecDLPNotifierService

Starting a detection server on Windows

Use the following procedure to start the Symantec Data Loss Prevention services on a detection server.

1. On the computer that hosts the detection server, navigate to **Start > All Programs > Administrative Tools > Services** to open the Windows Services menu.
2. Start the **SymantecDLPDetectionServerService** service.

Related Links
- Stopping a detection server on Windows on page 68

Stopping a detection server on Windows

Use the following procedure to stop the Symantec Data Loss Prevention service on a Windows detection server.

1. On the computer that hosts the detection server, navigate to **Start > All Programs > Administrative Tools > Services** to open the Windows Services menu.
2. Stop the **SymantecDLPDetectionServerService** service.

Related Links
- Starting a detection server on Windows on page 68

Starting services on single-tier Windows installations

Use the following procedure to start the Symantec Data Loss Prevention services on a single-tier installation on Windows.

1. On the computer that hosts the Symantec Data Loss Prevention server applications, navigate to **Start > All Programs > Administrative Tools > Services** to open the Windows Services menu.
2. Start the Symantec Data Loss Prevention in the following order:
   - SymantecDLPNotifierService
   - SymantecDLPManagerService
   - SymantecDLPIncidentPersisterservice
   - SymantecDLPDetectionServerControllerService
   - SymantecDLPDetectionServerService

   **NOTE**
   - Start the **SymantecDLPNotifierService** service before starting other services.

Related Links
- Stopping services on single-tier Windows installations on page 69
Stopping services on single-tier Windows installations

Use the following procedure to stop the Symantec Data Loss Prevention services on a single-tier installation on Windows.

1. On the computer that hosts the Symantec Data Loss Prevention server applications, navigate to Start > All Programs > Administrative Tools > Services to open the Windows Services menu.

2. From the Services menu, stop all running Symantec Data Loss Prevention services in the following order:
   - SymantecDLPDetectionServerService
   - SymantecDLPDetectionServerControllerService
   - SymantecDLPIncidentPersisterService
   - SymantecDLPManagerService
   - SymantecDLPNotifierService

Stop all Symantec Data Loss Prevention database sessions

Troubleshooting Enforce Server services

Rolling back to the previous Symantec Data Loss Prevention release

Creating the Enforce Reinstallation Resources file

Uninstalling a server from a Windows system

About troubleshooting Symantec Data Loss Prevention upgrade problems

If you experience problems with completing a successful product upgrade, see these topics:

• Troubleshooting Enforce Server services
• Rolling back to the previous Symantec Data Loss Prevention release

Troubleshooting Enforce Server services

If the Symantec Data Loss Prevention services do not start after you upgrade your system, check the log files for possible issues (for example, connectivity, password, or database access issues).

• Symantec Data Loss Prevention operational logs are in
  C:\ProgramData\Symantec\DataLossPrevention\<EnforceServer> or
  <DetectionServer>\15.7\logs.
• Oracle logs can be found in
  %ORACLE_BASE%\diag\rdbms\protect\protect\trace\alert_protect.log
  on the Oracle server computer.

You may also need to install the Update for Universal C Runtime in Windows. See https://support.microsoft.com/en-us/kb/2999226.

Rolling back to the previous Symantec Data Loss Prevention release

If you experience problems with the new version of Symantec Data Loss Prevention, you can roll back to the previous release.

To roll back to a previous release, you must have the following available:
• The Symantec Data Loss Prevention license file for your deployment.
• If your deployment uses Symantec Management Console, the host name or IP address of the Symantec Management Console server to use for managing Symantec Data Loss Prevention Endpoint Agents.
• A backup of the Symantec Data Loss Prevention Oracle database. For more information, see the Symantec Data Loss Prevention System Maintenance Guide.
• The location of the Oracle Base and Home directories.
• The Administrator credentials for your Symantec Data Loss Prevention deployment.
• The credentials for connecting to the Oracle database.
• The type of authentication that is used in your Symantec Data Loss Prevention deployment.
• The host name or IP address and port number that the Enforce Server uses to communicate with the Oracle database.

Reverting the Enforce Server to a previous release

If the upgrade procedure fails for any reason, you can restore the previous versions of Symantec Data Loss Prevention. The procedure that is described in this section applies to any type of Symantec Data Loss Prevention installation (single-tier, two-tier, and three-tier).

NOTE

This procedure assumes that you have not uninstalled the previous Symantec Data Loss Prevention version Enforce Server and detection servers.

1. Stop all Symantec Data Loss Prevention services that are running on the version 15.7 Enforce Server.

   About Symantec Data Loss Prevention services

2. Disable all Symantec Data Loss Prevention services that are running on the version 15.7 Enforce Server.

3. Stop all the Oracle services.

4. Restore Symantec Data Loss Prevention services if you are reverting to version 15.5 or later.

   Symantec Data Loss Prevention version 15.5 and later services are backed up during the migration process. You must move the service files to the previous release Services folder.

   • Locate the backed up services at the following location:
     \Program Files\Symantec\DataLossPrevention\EnforceServer\vv.u\Protect\backup\service--<date>--<time>
   
   Replace vv.u with the previous version and <date>--<time> with the date and time the migration process completed.

   • Copy the following services:
     – SymantecDLPNotifier.conf
     – SymantecDLPManager.conf
     – SymantecDLPIncidentPersister.conf
     – SymantecDLPDetectionServerController.conf

   • Paste the services to the following location:
     \Program Files\Symantec\DataLossPrevention\EnforceServer\Services

5. Restore the Symantec Data Loss Prevention Oracle database from the latest backup.

   Consult the Oracle documentation for more information.

6. Restart all the Oracle services.

   Consult the Oracle documentation for more information.
7. Enable the services on the previous Symantec Data Loss Prevention version.

   Confirm that the **Startup type** is set to **automatic** for each service.

8. Start services on the previous Symantec Data Loss Prevention version.

### Reverting a detection server to the previous release

Perform the detection server rollback after you complete the Enforce Server rollback. If you roll back the detection server first, the detection server displays a **Unknown** status on the **System > Servers and Detectors > Overview > Server / Detector Detail** screen.

1. Stop all Symantec Data Loss Prevention services that are running on the detection server host.

2. Restore Symantec Data Loss Prevention services.

   Symantec Data Loss Prevention services are backed up during the migration process. You must move the service files to the previous release **Services** folder.

   - Locate the backed up services at the following location:

     \Program Files\Symantec\DataLossPrevention\DetectionServer\vv.u\Protect\backup\service-<date>-<time>

     Replace vv.u with the previous version and <date>-<time> with the date and time the migration process completed.

   - Copy the **SymantecDLPDetectionServer.conf** services.

   - Paste the service to the following location:

     \Program Files\Symantec\DataLossPrevention\DetectionServer\Services

3. Enable the services on the previous Symantec Data Loss Prevention version.

   Confirm that the **Startup type** is set to **automatic** for each service.

4. Start services on the previous Symantec Data Loss Prevention version.

### Creating the Enforce Reinstallation Resources file

Before you uninstall Symantec Data Loss Prevention, create an **EnforceReinstallationResources.zip** file using the Reinstallation Resources Utility. This file includes files such as the **CryptoMasterKey.properties** file and keystore files, which are required to connect Symantec Data Loss Prevention to an existing DLP database.

Each Symantec Data Loss Prevention installation encrypts its database using a unique **CryptoMasterKey.properties** file. An exact copy of this file is required if you intend to reuse the existing Symantec Data Loss Prevention database. If the **CryptoMasterKey.properties** file becomes lost or corrupted and you do not have a backup, contact Symantec Technical Support to recover the file.

Follow this procedure to create the **EnforceReinstallationResources.zip** file required by the Symantec Data Loss Prevention 15.7 installer.

### Creating the Enforce Reinstallation Resources file on Windows

1. Switch to the **\EnforceServer\15.7\Protect\bin** directory by running the following command:

   cd C:\Program Files\Symantec\DataLossPrevention\EnforceServer\15.7\Protect\bin

2. Generate an Enforce Reinstallation Resources file by running the following command:

   "C:\Program Files\Symantec\DataLossPrevention\EnforceServer\15.7\Protect\bin\ReinstallationResourcesUtility.exe"
export "C:\Program Files\Symantec\DataLossPrevention\EnforceServer\15.7\Protect C:\EnforceReinstallationResources.zip"

3. Identify this new `EnforceReinstallationResources.zip` when reinstalling Symantec Data Loss Prevention from your backup version.

If you reinstall using Silent Mode, you include the following parameters (in addition to other required parameters):

```
REINSTALLATION_RESOURCE_FILE="c:\EnforceReinstallationResources.zip"
```

If you choose to run the `EnforceServer.msi` file to complete the installation, on the Initialize Database panel select Preserve Database Data and specify the `EnforceReinstallationResources.zip` file.

Creating the Enforce Reinstallation Resources file

Uninstalling a server from a Windows system

The uninstallation process deletes all files and directories created by the installer. Complete the following backup tasks before uninstalling a server:

- Ensure that you have backed up all keystore files.
  See Backing up keystore files on Windows.
- Run the Reinstallation Resources Utility to create a backup of the `CryptoMasterKey.properties` file and Enforce Server keystore files.
  Creating the Enforce Reinstallation Resources file

1. If you are uninstalling Symantec Data Loss Prevention version 15.1 and you installed version 15.7 using Silent Mode, see TECH252462 for additional instructions.

2. Open the Add or Remove Programs control from the Windows Control Panel, select the Symantec Data Loss Prevention entry, and then click Change/Remove.

   The Symantec Data Loss Prevention Uninstall panel appears.

3. Click Next to uninstall Symantec Data Loss Prevention.

4. Click Finish to complete the uninstall process.

   NOTE
   The uninstall process automatically generates log information saved to a file `MSI*.log` (* is replaced with random characters) in the `%TEMP%` folder.

You can also use the following commands to uninstall Symantec Data Loss Prevention in Silent Mode:

- Run the following command to uninstall the Enforce Server:
  ```
  C:\msiexec /x EnforceServer.msi /qn /L*v c:\uninstall.log
  ```
- Run the following command to uninstall the detection server:
  ```
  C:\msiexec /x DetectionServer.msi /qn /L*v c:\uninstall.log
  ```
Applying a Maintenance Pack

Maintenance Packs can only be applied to an already installed version of Symantec Data Loss Prevention. For example, a maintenance pack for 15.7 can only be applied to Symantec Data Loss Prevention 15.7 (new or upgraded installation).

Before applying a maintenance pack or installing Symantec Data Loss Prevention, see the Symantec Data Loss Prevention System Requirements and Compatibility Guide for information about system requirements available at: Related Documents.

Steps to apply a maintenance pack on Windows servers

The following table describes the high-level steps that are involved in applying the maintenance pack to a Windows server. Each step is described in more detail elsewhere in this chapter, as indicated.

Before you apply a maintenance pack, create an EnforceReinstallationResources.zip file using the Reinstallation Resources Utility. This file includes the CryptoMasterKey.properties file and the keystore files for your Symantec Data Loss Prevention deployment. You can use the file to rollback to a previous version.

<table>
<thead>
<tr>

<td>Updating the detection server on Windows</td>
</tr>
</tbody>
</table>

Downloading the maintenance pack software for Windows servers

Copy the MSP files to the computer from where you intend to perform the upgrade. That computer must have a reliable network connection to the Enforce Server.

Copy the MSP files into a directory on a system that is accessible to you. The root directory where you move the files is referred to as the DLPDownloadHome directory.

Choose from the following files based on your current installation:

- Apply the maintenance pack to the Enforce Server: EnforceServer.msp
- Apply the maintenance pack to the detection server: DetectionServer.msp
- Apply the maintenance pack to a single-tier installation: SingleTierServer.msp
Updating the Enforce Server on Windows

These instructions assume that Symantec Data Loss Prevention 15.7 is installed and that the EnforceServer.msp file has been copied into the DLPDownloadHome directory on the Enforce Server computer.

**NOTE**
You can install the maintenance pack silently by running the following command:

```bash
msiexec /p "EnforceServer.msp" ORACLE_PASSWORD=<ORACLE PASSWORD>/qn /norestart /L*v EnforceServer.log
```

where <ORACLE PASSWORD> is the database password used for Symantec Data Loss Prevention 15.7.

1. Click **Start > Run > Browse** to navigate to the folder where you copied the EnforceServer.msp file.
2. Double-click **EnforceServer.msp** to execute the file, and click **OK**.
3. Click **Next** on the **Welcome** panel.
4. Enter the Symantec Data Loss Prevention database password in **Oracle Database Server Information** panel.
5. Click **Update**.

The update process may take a few minutes. The installation program window may display for a few minutes while the services startup. After the update process completes, a completion notice displays.

Updating the detection server on Windows

These instructions assume that Symantec Data Loss Prevention 15.7 is installed and the DetectionServer.msp file has been copied into the DLPDownloadHome directory on the detection server computer.

**NOTE**
You can install the maintenance pack silently by running the following command:

```bash
msiexec /p "DetectionServer.msp" /qn /norestart /L*v DetectionServer.log
```

1. Click **Start > Run > Browse** to navigate to the folder where you copied the DetectionServer.msp file.
2. Double-click **DetectionServer.msp** to execute the file, and click **OK**.
3. Click **Next** on the **Welcome** panel.
4. Click **Update**.

The update process may take a few minutes. The installation program window may display for a few minutes while the services startup. After the update process completes, a completion notice displays.

Updating a single-tier system on Windows

The following instructions assume that the SingleTierServer.msp file has been copied into the DLPDownloadHome directory on the Enforce Server computer.

**NOTE**
You can install the maintenance pack silently by running the following command:
msiexec /p "SingleTierServer.msp" /qn /norestart / L*v EnforceServer.log

1. Click **Start > Run > Browse** to navigate to the folder where you copied the **SingleTierServer.msp** file.
2. Double-click **SingleTierServer.msp** to execute the file, and click **OK**.
3. Click **Next** on the **Welcome** panel.
4. Click **Update**.

The update process may take a few minutes. The installation program window may display for a few minutes while the services startup. After the update process completes, a completion notice displays.
