

CA API Gateway - Enterprise Service Manager v1.17.0 Release Notes

Introduction	1
Known Issues	1
Semicolons in Message Context Keys	1
Page Breaks in PDF Output	2
Migrating System Cluster Properties	2
Issues Addressed in Release.....	2
Third-Party Software Acknowledgments	3

Introduction

This document summarizes version 1.17.0 of the CA API Gateway - Enterprise Service Manager.

Known Issues

Please note the following known issues when using the Enterprise Service Manager:

Semicolons in Message Context Keys

When grouping reports by message context keys, problems will occur if:

- The 'Key' field in a Message Context Assertion contains only a semicolon
- The value for a 'Key' field in a Message Context Assertion resolves to only a semicolon during run time.

For more information, refer to the following topics:

- "Capture Identity of Requestor Assertion" in the CA API Gateway online documentation located at: docops.ca.com/gateway.
- "Grouping by Message Context Key" in the Enterprise Service Manager online help.

Page Breaks in PDF Output

- When a report is generated without page breaks, the PDF output may consist entirely of blank pages. This is a known issue and is caused by the page size growing too large. If this occurs, use the HTML output instead or regenerate the report with page breaks.
- For more information, see the following topics in the Enterprise Service Manager online help:

Reports Tab

Generating Reports

Migrating System Cluster Properties

Migrating cluster properties between clusters is only supported for user-defined cluster properties. Problems may occur if you attempt to migrate cluster properties that are intended for system use (for example, *cluster.hostname*).

For more information on migration, see “Migrating a Service or Policy” and “Migration Page” in the Enterprise Service Manager online help.

Issues Addressed in Release

The following issues have been addressed:

- Corrected several vulnerabilities in the Enterprise Service Manager. (US212273)
- Encapsulated assertions are now included during policy migrations. They no longer already need to exist on the target Gateway. (US212260)
- Corrected an issue that cause migration problems when the Check Protected Resource Against CA Single Sign-On Assertion is involved. (DE207953)
- Added support for secure (stored) passwords, to resolve an “Unexpected error from cluster” message during migration. (DE207858)
- Updated the Enterprise Service Manager interface and documentation to reflect the current corporate branding. (US212247)
- Removed the disclosure of the Jetty version from HTTP responses. (US212255)
- Corrected the Service Summary Chart so that it displays correctly. (DE207964)
- Corrected an issue that prevented you from changing the session inactivity timeout. (DE208692)
- Correct dependency mapping of SiteMinder Check Protected Resource Configuration Name during migration (DE207953)

Third-Party Software Acknowledgments

To view the license agreements for third-party software used in this release, refer to “Third Party Software Acknowledgments” in docops.ca.com/gateway.
